INTRODUCTION

Ninety percent of a child's brain growth occurs before kindergarten and the quality of a child's early experiences impacts whether their brain will develop in positive ways that promote learning. First Things First (FTF) was created by Arizonans to help ensure that Arizona children have the opportunity to start kindergarten prepared to be successful. Understanding the critical role the early years play in a child's future success is crucial to our ability to foster each child's optimal development and in turn, impact all aspects of well-being in our communities and our state.

This Needs and Assets Report for the Coconino Region helps us in understanding the needs of young children, the resources available to meet those needs and gaps that may exist in those resources. An overview of this information is provided in the Executive Summary and documented in further detail in the full report.

The report is organized by topic areas pertinent to young children in the region, such as population characteristics or educational indicators. Within each topic area are sections that set the context for why the data found in the topic areas are important (Why it Matters), followed by a section that includes available data on the topic (What the Data Tell Us).

The FTF Coconino Regional Partnership Council recognizes the importance of investing in young children and ensuring that families and caregivers have options when it comes to supporting the healthy development and education of young children in their care. It is our sincere hope that this information will help guide community conversations about how we can best support school readiness for all children in the Coconino Region. To that end, this information may be useful to local stakeholders as they work to enhance the resources available to young children and their families and as they make decisions about how best to support children birth to age 5 in communities throughout the region.

ACKNOWLEDGEMENTS

The First Things First (FTF) Coconino Regional Partnership Council wishes to thank all of the federal, state and local partners whose contributions of data, ongoing support and partnership with FTF made this report possible. These partners included the Arizona Departments of Administration (Employment and Population Statistics), Child Safety, Economic Security, Education and Health Services; Child Care Resource and Referral; and the U.S. Census Bureau. We are especially grateful for the spirit of collaboration exhibited by all our partners as we, as a state, continue to recover from the COVID-19 pandemic.

We also want to thank parents and caregivers, local service providers and members of the public who attended regional council meetings and voiced their opinions, as well as all the organizations working to transform the vision of the regional council into concrete programs and services for children and families in the Coconino Region

Lastly, we want to acknowledge the current and past members of the FTF Coconino Regional Partnership Council whose vision, dedication and passion have been instrumental in improving outcomes for young children and families within the region. As we build upon those successes, we move ever closer to our ultimate goal of creating a comprehensive early childhood system that ensures children throughout Arizona are ready for school and set for life.

EXECUTIVE SUMMARY

The Coconino Region. The First Things First (FTF) Coconino Region includes most, but not all, of Coconino County and parts of neighboring Mohave County and Navajo County. The region includes the lands belonging to the Hopi Tribe (including the part in Navajo County), the Kaibab Band of Paiute Indians (which is mostly in Mohave County) and the Havasupai Tribe, as these three tribes have chosen to participate as part of the Coconino Region. This decision must be ratified every two years, and each of these tribes has opted to continue as part of the region, with the opportunity to be represented on the Regional Partnership Council. The region does not include the lands belonging to the Navajo Nation or the Hualapai Tribe. In the southern part of the county, the city of Sedona is assigned to the Yavapai Region and the Forest Lakes community is assigned to the Navajo/Apache Region. The city of Winslow is assigned to the Coconino Region, although it is located in Navajo County.

Population Characteristics. According to the U.S. Census, the Coconino Region had a population of 135,515 in 2020, a 9% increase from 2010, when 124,238 people resided in the region. Conversely, the population of young children birth to age 5 decreased 18% over the same period from 9,652 in 2010 to 7,961 in 2020. This pattern was similar to that seen across the state as a whole which experienced a 12% increase in the total population, but a 12% decrease in the population of young children from 2010 to 2020. Just over one in 10 households (12%) in the region included a child birth to age 5 in 2020, similar to the proportion of households across the state including a young child (13%).

The 2020 Census undercount of young children appears more pronounced in the Coconino Region than that seen across the state, as the total number of live births in the region between 2015 and 2020 (8,265) is 3.8% higher than the total number of children birth to age 5 in the 2020 Census (7,961). Across the state, a 1.4% difference is seen comparing the same indicators.

Most Coconino Region residents identify as non-Hispanic White (61% of all age population, 49% of children birth to age 4). Young children in the region are more likely to be identified as Hispanic or Latino (24%) than all residents (18%), although both are lower than the population of young children (44%) and all ages (31%) identifying as Hispanic or Latino across the state. The Coconino Region also has a lower proportion of the total population and children birth to age 4 identified as Black or African American (3% for both), Asian or Pacific Islander (4% and 5%) or Multiracial (10% and 16%) than the state across these categories. Conversely, the proportion of both the total population and children birth to age 4 identified as American Indian (20% and 31%, respectively) was higher than across the state (6% and 8%, respectively).

Eight percent of children birth to age 5 in the region live with foreign-born parents, a much lower proportion than across the state overall (24%). Household language use also reflects these demographic patterns; a smaller proportion of individuals speak Spanish at home in the Coconino Region (7%) compared to the state overall (20%). Of those who speak a language other than English at home, a smaller proportion of individuals do not speak English “very well” in the region (4%) compared to the

state (8%). Similarly, the percentage of limited-English-speaking households in the region (2%) is half that of the state (4%).

The number of English Language Learners (ELL) increased in both Coconino County and the state between the 2020-21 and 2021-22 school years, with 803 ELL students enrolled in all grades in Coconino County in the 2021-22 school year. This represents 5% of students enrolled in all grades in the county that school year. English Language Learners are identified through the Arizona Department of Education (ADE) Home Language Survey, which asks families about the student's first language and what language is spoken at home most of the time. In the 2021-22 school year, there were 253 students in Coconino Region schools who indicated speaking any Native language at home, an increase from 227 in the 2020-21 school year. Nearly all of these students reported use of the Navajo language at home, while fewer than 11 students had reported Hopi home language use or Supai home language use in either school year.

Most young children in the Coconino Region live in two-parent households; 63% live with two married parents or stepparents, which is slightly lower than Arizona overall (59%). Almost one-third of children in the region (32%) live in a household with one parent, a lower proportion than across the state (37%).

Thirteen percent of children birth to age 5 in the region live in their grandparent's household, identical to the proportion of young children in those living situations across the state (13%). Of grandparents who live with and are responsible for their grandchildren under age 18 in the Coconino Region, most are 60 or older (64%), female (65%) and in the labor force (61%). Just over one-quarter (28%) do not have the child's parent in the household, lower than the proportion across the state (33%). Overall, in the Coconino Region, 12% of grandparents have grandchildren under the age of 18 living in their household with no parent present, slightly higher than the proportion across the state (11%).

Economic Circumstances. Median family income for families in Coconino County is higher than for families in Arizona across all household types. The median income for married couple families with children in Coconino County (\$103,300) is higher than married couple families across Arizona (\$100,000). This income is however, more than double the median income for single-male-headed families (\$48,500) and almost triple that of single-female-headed families (\$36,800) in Coconino County.

According to 2017-2021 American Community Survey (ACS) estimates, rates of poverty across the entire population in the region (17%) and state (13%) are more similar than for children birth to age 5 (12% in the region and 20% across the state). Rates of poverty for young children have decreased since 2012-2016 ACS estimates to a greater degree in the region (2012-2016, 30%; 2017-2021, 12%) than across the state (2012-2016, 28%; 2017-2021 20%). Nearly a third of young children in the Coconino Region (31%) live below 185% of the poverty level, lower than across the state (39%). Even this higher category for a family of four (185% FPL = \$50,836) is far below the self-sufficiency standard for two parents with one infant and one preschooler in 2022 in Coconino County (\$82,812). This indicates that many families across the region may have less income than needed to fully support themselves.

Between state fiscal years (SFY) 2018 and 2022, both the number of families with children birth to age 5 and total number of children birth to age 5 receiving Temporary Assistance for Needy Families (TANF) decreased overall in the region and the state. In the region, large decreases from SFY 2018 to 2019 were followed by increases through SFY 2021 before both numbers decreased again in SFY 2022. In SFY 2022, the percentage of young children participating in TANF in the region (1.6%) was slightly lower than the state overall (2.8%).

Participation in the Supplemental Nutrition Assistance Program (SNAP) by households with young children declined in the Coconino Region between SFY 2018 and 2022, as did participation across the state. The number of young children birth to age 5 participating in SNAP also decreased during those years in both the region and state. The percentage of young children participating in SNAP was higher in the region than across the state during SFY 2018 through 2021, before falling just below the state in SFY 2022. In that year, 39% of children birth to age 5 participated in SNAP in the region, similar to the 40% across the state.

The number of children birth to age 4 enrolled in and participating in the Special Supplemental Nutrition Program for Women, Infants and Children (WIC) in the Coconino Region and across the state generally declined in recent years, with the exception of a slight uptick in enrollment and participation in the region and state in 2022. WIC participation rates were high in 2022, with 95% of enrolled women, 97% of enrolled infants and 90% of enrolled children receiving benefits that year in the Coconino Region.

The number of lunches served through the National School Lunch Program (NSLP), Summer Food Service Program (SFSP) and Child and Adult Care Food Program (CACFP) varied substantially between program years 2019-20 and 2021-22. After the change in school meal policy following the start of the COVID-19 pandemic, meal service through SFSP increased almost sixfold in Coconino County between 2019-20 and 2020-21, while meal service through NSLP fell almost fourfold. In the 2021-22 school year, NSLP meal service increased and SFSP meal service decreased, although neither program has yet returned to pre-pandemic levels. Compared to 2019-20, the number of lunches served through CACFP more than doubled in Coconino County in 2021-22, indicating higher ongoing participation in CACFP following the onset of the COVID-19 pandemic.

Unemployment rates in Coconino County track with Arizona's but tend to be slightly higher. Despite the spike during the onset of the COVID-19 pandemic in 2020, unemployment rates fell to their lowest level in six years in 2022 with a 4.3% unemployment rate in Coconino County and a 3.8% rate across Arizona. The labor force participation rate in the Coconino Region (63%) is slightly higher than that across Arizona as a whole (61%). As a result, the region also has a lower proportion of adults who are not in the labor force (37%) compared to Arizona as a whole (39%).

An estimated 90% of young children in the Coconino Region live in families with at least one parent in the labor force, the same as the proportion across the state (90%). A little over two-thirds of children birth to age 5 in the region (68%) live with all parents in the labor force, making it likely that these families need some form of child care.

Traditionally, housing has been deemed affordable for families if it costs less than 30% of annual household income. Just over one third (34%) of households in the region spend 30% or more of their income on housing, slightly higher than the proportion across the state (29%). Housing costs differ by home ownership status, with fewer homeowners in the region (19%) and state (21%) spending 30% or more of household income on housing, compared to more than half (52%) of renter-occupied households in the region and 45% across the state. The McKinney-Vento Act definition of homelessness includes children living in shelters, transitional housing, campgrounds, motels, trailer parks and cars, as well as children whose families are temporarily living within another family's household. The number of students enrolled in public and charter schools in the region experiencing homelessness fell by more than half between 2019-20 (n=323) and 2021-22 (n=130), a much larger decrease than seen statewide.

More than eight in 10 households (84%) in the Coconino Region have both a computer (including smartphones) and broadband internet connectivity, just below the proportion across the state overall (88%). Looking at the population, the majority (87%) of individuals of all ages in the Coconino Region live in households with both a computer and internet connection. Children are slightly more likely to live in a household with a computer and an internet connection, with 89% of those under age 18 with this access in the region.

Educational Indicators. In the 2021-22 school year, 208 children were enrolled in preschool in the Coconino Region. Kindergarten through 3rd grade enrollments for the region were all much higher, ranging from a low of 1,162 in 1st grade to a high of 1,215 children enrolled in 2nd grade. Kindergarten through 3rd grade chronic absence rates nearly quadrupled, increasing from 10% in the 2019-20 school year to 37% in 2021-22 in the Coconino Region, with similar increases seen across the state.

In the 2021-22 school year, 37% of 3rd grade students in the Coconino Region were meeting or exceeding proficiency expectations for 3rd grade English Language Arts, just below the proportion across the state (41%). A slightly lower percentage (33%) were meeting or exceeding proficiency expectations for Math, again a lower proportion than for students across the state (40%). In the region, passing rates for the 3rd grade English Language Arts assessment increased from 30% in the 2020-21 school year to 37% in the 2021-22 school year. During the same period, passing rates increased from 35% to 41% across the state. Third grade Math passing rates also increased in the region and state between the 2020-21 and 2021-22 school years, from 26% to 33% in the region, and from 36% to 40% across the state.

Four- and five-year graduation rates in the Coconino Region have remained above state rates in recent years. In 2021 (the most recent year of data available for both rates), the four-year graduation rate for the region was 84%, and the five-year graduation rate was 88%. Both rates were higher than state four- and five-year graduation rates that year (76% and 79%, respectively). The 7th-12th grade dropout rate for the Coconino Region rose overall from 1% in 2019-20 to 5% in 2021-22.

More than seven in 10 (72%) adults in the Coconino Region have more than a high-school education, higher than the proportion across the state (65%). The share of adults with a Bachelor's degree or higher educational attainment (40%) is notable higher in the region than in Arizona overall (31%). In 2020,

87% of births in the region were to mothers who had at least a high school diploma, General Educational Development certificate (GED) or higher educational attainment, decreasing slightly to 86% in 2021, similar to proportions across Arizona in 2020 (84%) and 2021 (85%).

Early Learning. In the Coconino Region, 45% of children (ages 3 and 4) are estimated to be enrolled in preschool or kindergarten, which is a higher proportion than across the state (37%). Preschool enrollment in the region has decreased slightly in recent years from 46% to 45%, as has state preschool enrollment (37% to 36% during the same period). In 2021, preschool enrollment in Arizona hit a 10-year low, which makes the Coconino Region's decrease in enrollments not surprising.ⁱ

Nearly all licensed child care capacity in the region is provided by child care centers (99.6%), with less than 1% provided by family child care providers. Given that there are 5,183 children with all parents in the labor force in the region according to the 2017-2021 ACS, an availability of only 3,147 center-based child care slots (the most available type of care in the region) suggests that many of these parents face challenges in finding quality child care for their children.

An area is labeled a child care desert if the ratio of children to child care slots is three to one or more. Looking collectively across all children birth to age 5, the Coconino Region is not considered a desert. However, infant care availability is much more limited. There are nearly eight (7.8) times the number of infants in the region as available licensed slots for those children. Across the state this deficit is even more extreme, with 10 times the number of infants to available infant care slots. For 1-year olds in the region, there is a ratio of three 1-year-old children to every slot, meaning the region also qualifies as a child care desert for that age group. There were only 157 slots for infants and 420 for 1-year olds in Arizona Department of Health Services (ADHS)-licensed child care providers in July 2023 in the region. Given that the 2020 Census estimated 2,466 children under age 2 in the region, this child care capacity may not meet the needs of all who want or need care for their very young children.

The median monthly costs of child care provided by certified family homes in Coconino County are the lowest priced type of care in the region at \$525 per month for all children birth to age 5 for full-time care. Across other types of care, care for infants is the most expensive in the county and the state, with the median monthly cost for infant care in licensed centers (\$945) and small group homes (\$735) in the county just below the costs of that care across the state (\$949 and \$761, respectively). Only infant care in public schools in the county (\$1,050) exceeds infant care costs across the state (\$1,011). Licensed centers and public schools providing child care in Coconino County are notably more expensive than home-based care, and there are relatively few slots with the more budget-friendly home-based providers.

Child care costs as a percentage of income are similar in Coconino County and the state overall. In 2022, sending an infant to a licensed center in Coconino County cost just under one-sixth (15%) of a family's income, the same as for families across the state (15%). The percentage of income spent on older children's care is slightly lower in comparison in both the region and state. Median child care costs have also been increasing in the county and state since 2018. For example, the cost of care for the most

ⁱ For more information, see the <https://www.firstthingsfirst.org/wp-content/uploads/2023/12/State-Needs-and-Assets-Report-2023.pdf>

available type of care in the county, licensed centers, increased 25% for one infant, 20% for one 1-2 year old and 15% for one 3-5 year old between 2018 and 2022.

The number of children eligible for and receiving Arizona Department of Economic Security (DES) child care assistance in the region has mirrored the pattern seen across the state in recent years. Increases in both the number of children eligible for and the number of children receiving assistance in the year after the onset of the COVID-19 pandemic (2021) were followed by decreases in both the region and state in 2022. The proportion of eligible families not using DES child care assistance also decreased in the state from 2020 (18.3%) to 2022 (9.2%). However, in the Coconino Region, decreases seen from 2020 (26.5%) to 2021 (9%) were followed by an increase in 2022, when 11% of eligible families did not use this assistance.

Children are automatically eligible for DES child care assistance when they are involved with the Arizona Department of Child Safety (DCS). For DCS-involved children, the number of children eligible for assistance in the region has decreased in recent years, from 156 young children in 2018 to 121 in 2022, mirroring the pattern seen across the state. Again, like the pattern seen across the state, the receipt of DES assistance among eligible DCS-involved children increased from 2020 to 2021, but then decreased again in 2022 in the region.

The 31 Quality First child care providers in the Coconino Region enrolled 1,197 young children in 2023. Over three-quarters (77%) of children in Quality First sites in the region were enrolled at a site with a 3- to 5-star rating, indicating a high quality provider. About one in seven children enrolled in Quality First provider sites in the region (157 of 1,197; 13%) were served by Quality First Scholarships in 2023. Four licensed or registered child care providers in the region are nationally accredited, representing 8% of providers in the region. These accredited providers have the capacity to serve 276 children, which represents 9% of child care capacity in the region. DES defines quality environments as child care providers with a 3- to 5-star Quality First rating, a national accreditation, or a Child Development Associate (CDA) credential for family child care providers. At the regional level in 2022, 74% of young children not involved with DCS and 94% of DCS-involved children receiving DES child care assistance were enrolled in quality environments, a higher proportion than across the state as a whole (68% non-DCS; 72% DCS). This suggests better access to high quality care for low-income children in the Coconino Region compared to Arizona overall.

Children birth to age 2 are most frequently referred to the Arizona Early Intervention Program (AzEIP) by physicians in both the Coconino Region and across the state. Family referrals have been consistently lower in the region than across the state in recent years, with just 9% of referrals from families in federal fiscal year (FFY) 2022 in the region compared to 21% across the state. Just over one-third (35%) of young children referred to AzEIP in FFY 2022 were found eligible (13%) or received services (22%) in the Coconino Region, slightly lower than the 37% referred across the state who were found eligible (16%) or received services (21%). AzEIP service coordinators in the region were similarly likely to make contact with those referred (20% no contact) compared to the state (19% no contact), and referred children were slightly more likely to have had a formal evaluation and found not to have a qualifying developmental delay (18% region; 22% state).

In the Coconino Region between 2018 and 2022, the number of children birth to age 2 receiving services from AzEIP increased notably between October 2018 (n=99) and October 2019 (n=123) but decreased over the next three years, ending at 89 children birth to age 2 receiving services as of October 1, 2022. Numbers served decreased from 2018 to 2021 across the state, but then increased from 2021 to 2022.

The Coconino Region did not see a similar drop in the number of children birth to age 5 receiving services from the Division of Developmental Disabilities (DDD) from SFY 2020 to 2021 as seen across the state, but both the region and state were serving a notably lower number of children in SFY 2019 to 2022, compared to SFY 2017 and 2018. In SFY 2022, 29 children birth to age 5 received DDD services in the Coconino Region, fewer than the previous year (n = 38). Across the state the number of children receiving DDD services increased from SFY 2021 to 2022.

Qualifying children may receive services from AzEIP and/or DDD, a number which can be used to estimate the total number of young children receiving early intervention services in a region. The total number of children birth to age 2 receiving AzEIP and/or DDD services declined overall between SFY 2019 and 2022 in both the region and the state. However, while statewide service numbers increased between SFY 2020 and 2021, service numbers in the Coconino Region did not increase until SFY 2022, and only by a single child. In SFY 2022, 73 young children received AZEIP and/or DDD services in the region. Based on 2020 Census population counts, 2.0% of children birth to age 2 were receiving AzEIP and/or DDD services in the region, compared to 2.6% across the state, in SFY 2022.

The number of preschoolers with disabilities served in ADE local education agencies (LEAs) has decreased in both the region and the state since SFY 2020. In SFY 2022, only 123 preschoolers with disabilities were served in the Coconino Region, the lowest number served since SFY 2018. In the region, more than four in 10 (45%) of those preschoolers were receiving services for a speech or language impairment, compared to only three in 10 (30%) across the state. Twenty-eight percent of preschoolers with disabilities receiving LEA services in the region had a development delay and another 24% had a preschool severe delay.

The pattern of kindergarten through 3rd grade student enrollment in special education in public and charter schools between SFY 2018 and 2022 was different for the region and the state. Enrollments increased overall in the state but decreased overall in the region over those years. In SFY 2022, 42% of the 610 students (K-3rd) enrolled in special education in the region were diagnosed with a speech or language impairment, 25% with a developmental delay and 13% with a specific learning disability, proportions similar to the state. In the region, a smaller proportion were diagnosed with autism (6%) compared to the state (11%).

Child Health. In the Coconino Region, about one in 10 people of all ages (9%) do not have health insurance coverage, a slightly lower proportion than across the state of Arizona overall (11%). Health insurance coverage for young children specifically is slightly higher than that of the overall population in the region, with 8% of children birth to age 5 not having health insurance, again similar to the

proportion seen across the state (7%). The proportion of young children without health insurance has also decreased in the region, county and state in recent years.

The proportion of births in the region paid for by the Arizona Health Care Cost Containment System (AHCCCS) or the Indian Health Services (IHS, which covers less than 3% of births in the Coconino Region) has remained relatively stable in the region going from 49% in 2018 to 48% in 2022. This proportion has decreased in the state over those same years, from 51% to 47%.

Rates of timely prenatal care have risen overall in recent years, from 69% in both the region and state in 2018 to 71% for both in 2022. In the region, 1.2% of births were to mothers who received no prenatal care at all and 4.5% were to those who had fewer than five visits, slightly lower proportions than of the births across the state (2.3% and 4.7% respectively).

The region has seen an overall decrease in the proportion of births to teenaged mothers between 2018 and 2022, a pattern similar to what was seen across the state, with the exception of an uptick in the region in 2021 not seen across the state. Births to mothers under age 20 fell from 5.8% in 2018 to 3.6% in 2022 in the region, from a proportion higher than across the state to one that is lower. The Coconino Region also has a relatively low proportion of births to mothers who smoked cigarettes while pregnant, and this proportion has decreased from 3.7% in 2019 to 2% in 2022. In all years between 2018 and 2022, the region met the Healthy People 2030 target for smoking during pregnancy of 4.3% or less. Between 2018 and 2022, 137 newborns in the region were hospitalized because of maternal drug use during pregnancy, with an average length of stay of 13.1 days. In the region, this equates to 2.1 per 100 live births requiring hospitalization due to maternal drug use, compared to 3.3 per 100 statewide.

More than a quarter of births in the region and state in recent years were to mothers with pre-pregnancy obesity, with this proportion increasing in the region from 25.9% in 2018 to 30.3% in 2022. The proportion of births to mothers with gestational diabetes has also increased in the region from 8.2% in 2018 to 12.4% in 2022.

The proportion of babies born at low birth weight are similar in the region and state, with 8.6% of births at low birth weight in the Coconino Region and 7.8% across Arizona in 2022, with a slight increase overall in the region since 2020 (7.4%). The proportion of preterm births (less than 37 weeks gestation) was slightly lower in the region compared to the state in recent years (with the exception of 2019), with the region at 8.1% and the state at 10% in 2021 (the most recent year that both data points are available). In 2022, 9.4% of births were preterm in the region, meaning that the region just met the Healthy People 2030 target of 9.4% or fewer births before 37 weeks gestation, although this proportion in the region in 2022 was higher than in the previous two years (8.1% for both 2020 and 2021). Births with an admission to a neonatal intensive care unit (NICU) in the region have varied over the last five years, falling below state rates between 2019 and 2021. In 2022, 7.4% of births in the region had a NICU admission. In the Coconino Region, rates of breastfeeding were higher than those across the state from 2018 through 2022. In 2022, 91% of WIC-enrolled infants were ever breastfed, compared to 79% statewide.

Childhood immunizations protect against many diseases, including diphtheria, tetanus and pertussis (DTaP); polio; and measles, mumps and rubella (MMR). Across all required immunizations, children in

child care in the Coconino Region had similar vaccination rates (DTaP 90.3%; Polio 90.8%; MMR 92.7%) compared to the state as a whole (DTaP 90.6%; Polio 92.2%; MMR 93%) in the 2022-23 school year. Both the Coconino Region and the state met the Healthy People 2030 DTaP immunization target of 90%. Immunization exemptions among children in child care have been lower in the region than the state since the 2021-22 school year, and the region has seen decreases in exemptions from all immunizations since the 2019-20 school year, whereas the state has seen slight increases over those years. In the 2022-23 school year, 2.5% children in child care in the region were exempt from all vaccines, compared to 4% across the state.

The Coconino Region had lower kindergarten immunization rates in the 2022-23 school year (DTaP 78.9%; Polio 79.5%; MMR 78.8%) compared to the state (DTaP 89.6%; Polio 90.3%; MMR 89.9%). Both the region and state failed to meet the Healthy People 2030 kindergarten MMR immunization target of 95%. In promising news, exemptions from all immunizations decreased in the region from the 2018-19 (5%) to 2022-23 (3.5%) school years, whereas rates across the state increased overall during that period from 3.8% to 4.6%. Personal belief exemptions remained relatively constant in the region between the 2018-19 (6%) and 2022-23 (6.2%) school years and slightly increased statewide during the same period (5.9% 2018-19; 7.3% 2022-23).

The pattern of confirmed and probable cases of respiratory syncytial virus (RSV) and influenza in young children birth to age 5 were similar in both the region and state with an increase in RSV cases since 2021, but a marked decrease in influenza in 2021 that was followed by a steep increase. In 2022, there were 349 cases of RSV and 178 cases of influenza in young children in the region, the highest numbers since 2019.

Falls were the most common unintentional injuries that led to emergency department visits for children birth to age 4 in both the region and the state between 2018 and 2022, followed by ‘other’ injuries and being ‘struck by or against’ an object or person. During those years, there were 1,193 emergency department visits due to falls in the region, 396 for other reasons, and 335 due to being struck. The pattern of injuries prompting inpatient hospitalizations were also similar for the region and state, with falls being the most common followed by poisoning. Between 2018-2022, 16 young children in the region were hospitalized due to falls, and 15 due to poisoning.

Between 2019 and 2021, the infant mortality rate was similar in the Coconino Region (5.6 infant deaths per 1,000 live births) and the state (5.4), and neither met the Healthy People 2030 target of 5.0 or less. Fifty-seven children birth to age 17 died in the region between 2018 and 2021. Just under one in five deaths (18%) in the region were due to accidents, with congenital malformations, intentional self-harm/suicide and sudden infant death syndrome (SIDS) each accounting for 11% of deaths in the region. Across the state, accidents (20%) and congenital malformations (15%) were the two leading causes of death of children under 18, and intentional self-harm/suicide (6%) was the fourth leading cause of death.

Family Support and Literacy. The number of non-fatal opioid-related overdoses decreased in Coconino County between 2018 and 2020 – from 53 to 32, before increasing again in 2021 to 38. Unfortunately, this decrease in the intervening years may be because more overdoses were fatal. Overdose-related

deaths have increased markedly in the state in past years but had a less consistent trajectory in Coconino County, increasing overall between 2017 and 2021 from less than 10 to 28. To help address opioid addiction, the state of Arizona has made three resources available in recent years; the Opioid Assistance and Referral line launched in 2018, no cost availability of naloxone (also called Narcan, a medication that rapidly reverses opioid overdose) to many organizations across the state through ADHS and access to naloxone without a prescription at pharmacies.

The number of child abuse and neglect reports assigned for investigation by DCS in Coconino County decreased overall from 308 in the first half of 2020 to 287 in the second half of 2022 while there was a slight increase overall across the state during the same period. In addition, the number of children under 18 removed by DCS decreased overall in the county and across the state between January 2020 and December 2022. However, in the county in 2022, the number of children under 18 removed by DCS increased between the first (n=35) and second half (n=47) of that year, contrary to the continued decrease across the state during that period. Neglect was the most common type of substantiated maltreatment during this period in both the county (81%) and state (71%), followed by physical abuse (15% and 24% respectively).

In the last six months of 2022, more than half (55%) of young children birth to age 5 placed in out-of-home care by DCS across Arizona were able to remain with family through a kinship placement. Children in DCS custody most often exited out-of-home care to be reunified with their parents (55%) or adopted (39%). The number of licensed kinship foster homes in Arizona steadily declined between January 2018 and June 2022, though there was an uptick again in the latter half of 2022. Generally, fewer than one in five kinship homes are licensed, and the number of unlicensed kinship homes increased slightly overall during this period and exceeded the number of community foster homes during the first years of the pandemic.

ABOUT THIS REPORT

There is growing acknowledgement of the role our physical, social, and economic environments play in our day-to-day health and wellbeing.¹ These factors, known as the social determinants of health, have an especially strong effect on the development of young children ages birth to 5 and accumulate over time.^{2, 3} Measuring and addressing these conditions can significantly impact not only early health and education outcomes, but also health and economic circumstances later in life.^{4, 5, 6} It is important to acknowledge that structural inequities in access to quality health care, schools, and education as well as living, working and leisure conditions lead to disparate outcomes within and between groups of people.⁷ For example, the U.S.'s history of segregation, discriminatory policy and differential investment across communities has created generational disparities in outcomes for people of color.⁸ Native communities have additionally experienced periods of genocide, forced relocation and assimilation leading to systemically poorer economics and health compared with other groups.^{9, 10} This Needs and Assets Report covers many structural and social determinants of health including population characteristics, economic characteristics, early learning and educational indicators, child health, and family support and literacy for the First Things First (FTF) Coconino Region.

The data in this report come from a variety of sources including federal and state agencies and local agencies or service providers. Federal government sources include publicly available data from the 2020 Census and the 2017-2021 American Community Survey (ACS) 5-Year Estimates. Data in this report from the ACS summarize the responses from samples of residents taken between 2017 and 2021. Because these estimates are based on samples rather than the entire population, ACS data should not be considered exact. Estimates for smaller geographies, such as regions, are less accurate than estimates for larger geographies, such as the state, because they are based on smaller sample sizes.

Data were provided to FTF by state agencies including the Arizona Department of Health Services, the Arizona Department of Education and the Arizona Department of Economic Security. In most cases, the data in this report were calculated specifically for the Needs and Assets process and are more detailed than the data that are published by these agencies for the general public. Whenever possible, this report will use data tailored to the region, but in some cases, there are only county-level or statewide data available to report. This report also includes publicly available data for the state and counties to supplement data received through specific requests, including from state agencies such as the Arizona Department of Commerce's Office of Economic Opportunity and the Arizona Department of Child Safety semi-annual child welfare reports.

In most tables in this report, the top rows of data correspond to the FTF Coconino Region. Not all data are available at the FTF regional level because not all data sources analyze their data based on FTF regional boundaries. The other table rows present data that are useful for comparison purposes, including Coconino County, the state of Arizona and national estimates or targets where available. Data tables and graphs are as complete as possible. Data which are not available for a particular geography are indicated by the abbreviation "N/A." State agencies have varying policies about reporting small values. Entries such as "<11" are used when the count is too small to be reported and has been

suppressed to protect privacy. In some cases, table entries will indicate a range of values such as "1 to 9" because the suppression policy prevented the vendor from knowing the exact value, but comparison of these ranges of possible values to other values in the table or figure may still be useful. Table entries of "DS" indicate that data have been suppressed and we are unable to provide a useful range of possible values. Additional data tables not included in the body of the report can be found in Appendix 1.

THE COCONINO REGION

The First Things First (FTF) regional boundaries were initially established in 2007, creating 31 regions which were designed to (a) reflect the view of families in terms of where they access services, (b) coincide with existing boundaries or service areas of organizations providing early childhood services, (c) maximize the ability to collaborate with service systems and local governments and facilitate the ability to convene a Regional Partnership Council and (d) allow for the collection of demographic and indicator data. FTF also acknowledged the government-to-government relationship with federally-recognized tribes. Each tribe with lands in Arizona was given the opportunity to participate within an FTF designated region or elect to be designated as a separate region. The regional boundaries are reviewed every two years. In fiscal year 2015, the boundaries were modified using census blocks, creating 28 regions. This report uses the 2015 definition of the regional boundaries.

The FTF Coconino Region includes most but not all of Coconino County and parts of neighboring Mohave and Navajo counties. The region includes the lands belonging to the Hopi Tribe (including the part in Navajo County), the Kaibab Band of Paiute Indians (which is mostly in Mohave County) and the Havasupai Tribe, as these three tribes have chosen to participate as part of the Coconino Region. This decision must be ratified every two years, and each of these tribes has opted to continue as part of the region, with the opportunity to be represented on the Regional Partnership Council. The region does not include the lands belonging to the Navajo Nation or the Hualapai Tribe. In the southern part of the county, the city of Sedona is assigned to the Yavapai Region and the Forest Lakes community is assigned to the Navajo/Apache Region. The city of Winslow is assigned to the Coconino Region, although it is located in Navajo County.

Figure 1 shows the geographical area covered by the Coconino Region. Additional information available at the end of this report includes a map of the region by zip code and a table listing zip codes for the region in Appendix 3, and a map and a list of school districts in the region in Appendix 4.

POPULATION CHARACTERISTICS

POPULATION CHARACTERISTICS

Why It Matters

Accurate information about the number and characteristics of families allows policymakers and program providers to understand what resources are needed in their communities, including where services should be located and how to tailor offerings to the specific needs of those who are likely to use them.^{11, 12, 13, 14} For example, identifying which communities have high numbers of families with young children can facilitate strategic investments in libraries, playgrounds, health care facilities, social services and educational systems, which can help families with young children thrive.^{15, 16} Program and policy decisions that are informed by data on the composition of children's home and community environments help ensure more effective supports for families and have a greater chance to improve well-being, economic security and educational outcomes for children.

2020 Census data and its limitations

The release of 2020 Census data in 2023 provided updated information on the population of Arizona and the nation as a whole. However, the 2020 Census faced unprecedented challenges in conducting an accurate count of the population, the foremost of which included the COVID-19 pandemic and its related disruptions to institutions such as local and tribal governments, schools and health care facilities.^{17, 18, 19, 20, 21} Overall, data quality reviews of the 2020 Census have concluded that the data are generally reliable and accurate for the overall population; however, specific groups that have been undercounted in the past were again undercounted, often more severely.²² Young children birth to age 4 were undercounted by 3-5% nationwide (meaning that as many as one in 20 children birth to age 4 were missed by the Census).²³ Nationwide, American Indians living on reservations and Hispanic or Latino individuals were also undercounted by 5.6% and 5.0%, respectively, marking notable increases in undercounting rates compared to the 2010 Census (4.9% and 1.5%, respectively). These undercounts are important to keep in mind when using Census data, particularly data for young children and for communities with substantial American Indian and Hispanic or Latino populations. Undercounted communities risk receiving fewer resources for at least the next decade since the decennial census counts are the basis of many federal funding allocations.^{24, 25}

What the Data Tell Us

Population, race and ethnicity

While young children make up a small proportion of the overall population, their well-being has wide-reaching impacts on families, social service systems and the state's future population. Continued investment in children's well-being and the well-being of their families was deemed by the National Academy of Sciences as "the most efficient strategy" for strengthening the future workforce and supporting a thriving community.^{26, 27}

Knowing the racial-ethnic composition of communities can inform efforts to ensure equitable access to services and resources. Many racial and ethnic minority groups in the U.S. experience reduced access to health care services, more poverty and housing inequality, poorer living conditions and increased rates of homelessness in comparison to non-Hispanic White Americans.^{28, 29, 30, 31} These inequities result in disproportionately worse overall health as indicated by higher rates of disease and illness, untreated mental and physical health conditions and lower life expectancies within these groups.³² Understanding a community's racial-ethnic composition is also critical for identifying communities facing higher risks from environmental and public health hazards due to historic underinvestment and other factors—as the COVID-19 pandemic made woefully clear.³³

How the Coconino Region is faring

- According to the U.S. Census, the Coconino Region had a population of 135,515 in 2020 (Table 1), a 9% increase from 2010, when 124,238 people resided in the region (Table 2). Conversely, the population of young children birth to age 5 decreased 18% over the same period from 9,652 in 2010 to 7,961 in 2020. This pattern was similar to that seen across the state as a whole which experienced a 12% increase in the total population, but a 12% decrease in the population of young children from 2010 to 2020 (Figure 2).
- Just over one in 10 households (12%) in the region included a child birth to age 5 in 2020, similar to the proportion of households across the state including a young child (13%) (Table 1).
- The 2020 Census undercount of young childrenⁱⁱ appears more pronounced in the Coconino Region than that seen across the state, as the total number of live births in the region between 2015 and 2020 (8,265) is 3.8% higher than the total number of children birth to age 5 in the 2020 Census (7,961). Across the state, a 1.4% difference is seen comparing the same indicators (Figure 3).
- Most Coconino Region residents identify as Non-Hispanic White (61% of all age population, 49% of children birth to age 4). Young children in the region are more likely to be identified as Hispanic (24%) than all residents (18%), although both are lower than the population of young children (44%) and all ages (31%) identifying as Hispanic across the state. The Coconino Region also has a lower proportion of the total population and children birth to age 4 identified as Black or African American (3% for both), Asian or Pacific Islander (4% and 5%) or Multiracial (10% and 16%) than the state across these categories. Conversely, the proportion of both the total population and children birth to age 4 identified as American Indian (20% and 31% respectively) was higher than across the state (6% and 8% respectively) (Figure 4 & Figure 5).

ⁱⁱ See “2020 Census data and its limitations” at the beginning of the Population Characteristics section for fuller context on the 2020 Census undercount of young children.

Table 1. Population and households in the 2020 U.S. Census

Geography	Total population	Population (ages 0-5)	Total number of households	Number and percent of households with one or more children (ages 0-5)	
Coconino Region	135,515	7,961	48,308	5,995	12%
Coconino County	145,101	8,662	51,320	6,430	13%
Arizona	7,151,502	480,744	2,705,878	345,601	13%

Figure 4. Race and ethnicity of the population of all ages, 2020 Census

Source: U.S. Census Bureau (2023). 2020 Decennial Census, Demographic and Housing Characteristics (DHC), P6, P7, P8, P9, P12, P12A-W.

Note: The six percentages shown in this figure may sum to more or less than 100% because (a) persons reporting Hispanic ethnicity are counted twice if their race is Black, American Indian, Asian, Pacific Islander, or any combination of two or more races, (b) persons reporting any other race are not counted here unless they have Hispanic ethnicity, and (c) rounding.

Figure 5. Race and ethnicity for children birth to age 4, 2020 Census

Source: U.S. Census Bureau (2023). 2020 Decennial Census, Demographic and Housing Characteristics (DHC), P6, P7, P8, P9, P12, P12A-W.

Note: The six percentages shown in this figure may sum to more or less than 100% because (a) persons reporting Hispanic ethnicity are counted twice if their race is Black, American Indian, Asian, Pacific Islander, or any combination of two or more races, (b) persons reporting any other race are not counted here unless they have Hispanic ethnicity, and (c) rounding.

Immigrant families and language use

Both immigrants of all ages and children born to immigrant parents are growing populations in the U.S., and the U.S. is continuing to become an increasingly diverse nation.^{34, 35} Immigrant parents in Arizona have typically lived in the U.S. for at least nine years, and the vast majority of young children of these foreign-born parents are citizens.^{36, 37, 38} Some immigrant parents avoid using social services for which they and their children legally qualify due to fear of deportation or risking their legal status in the country.^{39, 40, 41} This can put immigrant families and children at risk of reduced access to medical care and increased food insecurity, which can lead to long-term impacts on health and educational attainment, as well as community-level economic impacts.^{42, 43, 44, 45} Understanding the needs of immigrant families and their children is essential to ensuring they have access to available resources that can help them thrive.⁴⁶

Language provides an important connection to family, community and culture.⁴⁷ Mastery of more than one language is an asset in school readiness and academic achievement and may offer cognitive and social-emotional benefits in early school experiences and across one's lifetime.^{48, 49, 50, 51, 52} However, families with lower English proficiency may face barriers to accessing information about health care and other services or engaging with their children's teachers. Children who do not yet have a full grasp of English may also experience difficulties in school, impeding their academic success and resulting in negative health outcomes.^{53, 54} Knowing the languages spoken and level of English proficiency in a region can inform the development of resources and services in multiple languages, ensuring that they are accessible to all families.^{55, 56}

How the Coconino Region is faring

- Eight percent of children birth to age 5 in the region live with foreign-born parents, a much lower proportion than across the state overall (24%) (Figure 6).
- Household language use also reflects these demographic patterns; a smaller proportion of individuals speak Spanish at home in the Coconino Region (7%) compared to the state overall (20%) (Figure 7).
- Of those who speak a language other than English at home, a smaller proportion of individuals do not speak English “very well” in the region (4%) compared to the state (8%) (Figure 8).
- Similarly, the percentage of limited-English-speaking households in the region (2%) is half that of the state (4%) (Figure 9).
- The number of English Language Learners (ELL) increased in both Coconino Region schools and the state between 2020-21 and 2021-22, with 803 ELL students enrolled in all grades in Coconino Region schools in the 2021-22 school year. This represents 5% of students enrolled in all grades in the county that school year (Table 4).
- English Language Learners are identified through the Arizona Department of Education (ADE) Home Language Survey, which asks families about the student's first language and what language is spoken at home most of the time. In the 2021-22 school year, there were 253

students in Coconino Region schools who indicated speaking any Native language at home, an increase from 227 in the 2020-21 school year. Nearly all of these students reported use of the Navajo language at home, while fewer than 11 students with reported Hopi language use or Supai language use in either school year.⁵⁷

Figure 6. Children birth to age 5 living with parents who are foreign-born, 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table B05009

Note: The term "parent" here includes stepparents.

Figure 7. Language spoken at home (by persons ages 5 and older), 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table C16001

Note: The three percentages in each bar may not sum to 100% because of rounding. The American Community Survey (ACS) no longer specifies the proportion of the population who speak Native North American languages for geographies smaller than the state. In Arizona, Navajo and other Native American languages (including Apache, Hopi, and O'odham) are the most commonly spoken (2%), following English (73%) and Spanish (20%).

Figure 8. English-language proficiency (for persons ages 5 and older), 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table C16001

Note: The three percentages in the figure should sum to 100%, but may not because of rounding.

Figure 9. Share of households that are limited-English-speaking, 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table C16002

Note: A "limited-English-speaking" household is one in which no one over the age of 13 speaks English very well.

Table 4. Number of English Language Learners enrolled in all grades, 2020-21 to 2021-22

Geography	Number of PS-12 students who were English Language Learners		Percent of PS-12 students who were English Language Learners	
	2020-21	2021-22	2020-21	2021-22
Coconino Region schools	796	803	5%	5%
Coconino County schools	827	815	5%	5%
Arizona schools	86,405	91,881	8%	8%

Source: Arizona Department of Education (2023). [Oct 1 Enrollment Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team.

Notes: English Language Learners are students who do not score 'proficient' in the English language based on the Arizona English Language Learning Assessment (AZELLA) and thus are eligible for additional supportive services for English language acquisition. Legislation in Arizona requires children in Arizona public schools be taught in English, and English Language Learners to attend English immersion programs. Senate Bill 1014 passed in 2019, increased the flexibility districts have in structuring English Language Learners immersion programs, and lessened the duration required of this instruction. For more information see <https://www.azed.gov/oelas/structured-english-immersion-models>

Family and household composition

Young children in Arizona live in many types of families, each of which has possible implications for child development.⁵⁸ For example, families with two married parents tend to offer stability that promotes child well-being.^{59, 60, 61} Single-parent households tend to be at higher risk for poverty, and can face challenges accessing health and education resources.^{62, 63, 64, 65, 66, 67, 68} Multi-generational living, particularly arrangements where grandparents live in the home with children and parents, has long been practiced in some cultures and communities but is becoming increasingly common in U.S. families of all racial and ethnic groups.^{69, 70, 71, 72} These living arrangements can offer financial and social benefits but also specific stressors, such as managing conflicts in parenting styles and family roles.^{73, 74, 75, 76, 77} It is also increasingly common for children to live in kinship care, defined as the care of children by someone other than their parents, such as relatives or close friends.^{78, 79, 80} These kinship caregivers, especially grandparents who care for their grandchildren, can face unique challenges, including navigating the logistics of informal guardianship (e.g., difficulties in registering children for school), coping with parental absence and addressing the challenges of being an aging caregiver for a young child.^{81, 82, 83, 84} Each of these family structures carries with it a unique set of strengths and challenges that are important to consider in relation to the health and development of children.^{85, 86, 87}

How the Coconino Region is faring

- Most young children in the Coconino Region live in two-parent households; 63% live with two married parents or stepparents, which is slightly lower than Arizona overall (59%). Almost one-third of children in the region (32%) live in a household with one parent, a lower proportion than across the state (37%) (Table 5).
- Thirteen percent of children birth to age 5 in the region live in their grandparent's household, identical to the proportion of young children in those living situations across the state (13%) (Figure 10).
- Of grandparents who live with and are responsible for their grandchildren under age 18 in the Coconino Region, most are 60 or older (64%), female (65%) and in the labor force (61%). Just over one-quarter (28%) do not have the child's parent in the household, lower than the proportion across the state (33%) (Table 6).
- Overall, in the Coconino Region, 12% of grandparents have grandchildren under age 18 in their household with no parent present, slightly higher than the proportion across the state (11%) (Figure 11).

Table 5. Living arrangements for children birth to age 5, 2017-2021 ACS

Geography	Estimated number of children (birth to 5 years old) living in households	Living with two married parents	Living with one parent	Living not with parents but with other relatives	Living with non-relatives
Coconino Region	8,054	63%	32%	2%	3%
Coconino County	8,922	57%	36%	4%	3%
Arizona	496,219	59%	37%	3%	2%
United States	23,353,556	64%	32%	2%	2%

Source: U.S. Census Bureau. (2022). American Community Survey five-year estimates 2017-2021, Tables B05009, B09001, & B17001

Note: The four percentages in each row should sum to 100%, but may not because of rounding. The term "parent" here includes stepparents. Please note that due to the way the ACS asks about family relationships, children living with two unmarried, cohabitating parents are not counted as living with two parents (these children are counted in the 'one parent' category).

Figure 10. Grandchildren birth to age 5 living in a grandparent's household, 2020 Census

Source: U.S. Census Bureau (2023). 2020 Decennial Census, Demographic and Housing Characteristics (DHC), Tables P14, PCT11.

Note: This table includes all children (under 6 years old) living in a household headed by a grandparent, regardless of whether the grandparent is responsible for them, or whether the child's parent lives in the same household.

Table 6. Selected characteristics of grandparents who are responsible for one or more grandchildren under age 18 in their households, 2017-2021 ACS

Geography	Estimated number of grandparents who live with and are responsible for grandchildren under 18 years old	Percent of these grandparents who:					
		Do not have the child's parents in the household	Are 60 years old or older	Are female	Do not speak English very well	In labor force	Have an income below the poverty level
Coconino Region	1,249	28%	64%	65%	16%	61%	16%
Coconino County	1,627	23%	60%	61%	23%	49%	24%
Arizona	56,079	33%	45%	62%	21%	57%	21%
United States	2,319,443	38%	47%	63%	14%	56%	18%

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Tables B10051, B10054, B10056, & B10059

Note: Grandparents are considered responsible for their grandchild or grandchildren if they are "currently responsible for most of the basic needs of any grandchildren under the age of 18" who live in the grandparent's household.

Figure 11. Percent of grandparents who are living with their grandchildren birth to age 17 with no parent present in the household, 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Tables B10051, B10054, B10056, & B10059

Note: The denominator in this figure is all grandparents living with grandchildren (including both grandparents who are responsible for their grandchildren and those that are not).

Additional data tables related to *Population Characteristics* can be found in Appendix 1 of this report.

ECONOMIC CIRCUMSTANCES

ECONOMIC CIRCUMSTANCES

Why it Matters

A family's economic stability impacts children's well-being and predicts a variety of health outcomes.⁸⁸ Children who grow up in poverty and unstable economic conditions are more likely to experience negative effects on their cognitive, behavioral, social and emotional development compared to those in stable economic environments.^{89, 90, 91, 92, 93} The challenges they face might continue into adulthood, and such difficulties may be passed on to the next generation.^{94, 95, 96} Poverty also affects children by straining parent well-being and parent-child interactions. Stressors related to poverty, like unemployment, food and housing insecurity and poor mental and physical health, make it difficult for caregivers to provide the necessary support for children's optimal development.⁹⁷ In light of these broad impacts, economic stability is a key social determinant of health and is included as a domain in the Healthy People 2030 Objectives.ⁱⁱⁱ

What the Data Tell Us

Income and poverty

Poverty is associated with reduced access to nutrition, green space and health care and greater exposure to psychosocial stress and environmental toxins, factors that can both directly and indirectly hinder children's growth and brain development.^{98, 99, 100} Children living in poverty are thus at a higher risk of negative impacts including being born at a low birth weight, lower school achievement and poor health.^{101, 102, 103, 104, 105, 106, 107} Economic hardship is included in some definitions of adverse childhood experiences (ACEs) and children living in poverty experience other non-economic ACEs, such as parental divorce or separation, exposure to violence, parental incarceration and living with someone with mental illness or a substance use disorder, at higher rates than children in higher income households.^{108, 109} Given the many negative effects of poverty on child development, programs that alleviate poverty through providing cash assistance or food, housing or health care assistance can improve child well-being.¹¹⁰

The Temporary Assistance for Needy Families Cash Assistance Program (TANF)^{iv} provides temporary cash benefits and supportive services to children and families. Eligibility is based on citizenship or qualified resident status, Arizona residency and limits on resources and monthly income.¹¹¹

ⁱⁱⁱ For more information on the Economic Stability Healthy People 2030 Objectives please see <https://health.gov/healthypeople/objectives-and-data/browse-objectives/economic-stability>

^{iv} For more information see: <https://www.acf.hhs.gov/ofa/programs/temporary-assistance-needy-families-tanf> and <https://des.az.gov/ca>

How the Coconino Region is faring

- Median family income for families in Coconino County is higher than for families in Arizona across all household types. The median income for married couple families with children in Coconino County (\$103,300) is higher than married couple families across Arizona (\$100,000). This income is, however, more than double the median income for single-male-headed families (\$48,500) and almost triple that of single-female-headed families (\$36,800) in Coconino County (Figure 12).
- According to 2017-2021 American Community Survey (ACS) estimates, rates of poverty across the entire population in the region (17%) and state (13%) are more similar than for children birth to age 5 (12% in the region and 20% across the state). Rates of poverty for young children have decreased since 2012-2016 ACS estimates to a greater degree in the region (2012-2016, 30%; 2017-2021, 12%) than across the state (2012-2016, 28%; 2017-2021 20%) (Figure 13 & Figure 14).
- Nearly a third of young children in the Coconino Region (31%) live below 185% of the poverty level, lower than across the state (39%) (Figure 15). Even this relatively higher income category for a family of four (185% FPL = \$50,836) is far below the self-sufficiency standard^v for two parents with one infant and one preschooler in 2022 in Coconino County (\$82,812). This indicates that many families across the region may have less income than needed to fully support themselves.
- Between state fiscal years (SFY) 2018 and 2022, the number of families with children birth to age 5 and children birth to age 5 receiving TANF decreased overall in the region and the state. In the region, large decreases from SFY 2018 to 2019 were followed by increases through SFY 2021 before both numbers decreased again in SFY 2022. In SFY 2022, the percentage of young children participating in TANF in the region (1.6%) was slightly lower than the state overall (2.8%) (Figure 16 & Figure 17).

^v For more information on the Arizona 2022 Self-sufficiency standard, please see https://womensgiving.org/wp-content/uploads/2022/12/AZ2022_SSS_Web.pdf

Figure 12. Median family income for families with children birth to age 17, 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table B19126

Note: Half of the families in the population are estimated to have annual incomes above the median value, and the other half have incomes below the median. The median family income for all families includes families without children birth to age 17.

Figure 13. Rates of poverty for persons of all ages and for children birth to age 5, 2017-2021 ACS

Source: U.S. Census Bureau. (2020). American Community Survey 5-year estimates 2017-2021, Table B17001

Note: This graph includes only persons whose poverty status can be determined. Adults who live in group settings such as dormitories or institutions are not included. Children who live with unrelated persons are not included. In 2021, the poverty threshold for a family of two adults and two children was \$27,479; for a single parent with one child, it was \$18,677.

Figure 14. Rates of poverty for children birth to age 5, 2012-2016 and 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table B17001. U.S. Census Bureau. (2017). American Community Survey 5-year estimates 2012-2016, Table B17001.

Note: This graph includes only persons whose poverty status can be determined. Adults who live in group settings such as dormitories or institutions are not included. Children who live with unrelated persons are not included. In 2021, the poverty threshold for a family of two adults and two children was \$27,479; for a single parent with one child, it was \$18,677.

Figure 15. Children birth to age 5 living at selected poverty thresholds, 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table B17024

Note: The four percentages in each bar should sum to 100% but may not because of rounding. In 2021, the poverty threshold for a family of two adults and two children was \$27,479; for a single parent with one child, it was \$18,677. The 185% thresholds are \$50,836 and \$34,552, respectively.

Food security

Many families struggle with consistent access to “enough food for an active, healthy life,” a problem known as food insecurity.¹¹² Food insecurity is linked with many aspects of child and parent well-being; it can be a major source of stress for parents and has been linked to health and behavioral problems for children, such as poorer parent-child attachment, decreased social skills and self-control and increased risk of depression.^{113, 114, 115, 116, 117, 118}

The Supplemental Nutrition Assistance Program (SNAP; also referred to as “nutrition assistance” and “food stamps”),^{vi} is administered by the Arizona Department of Economic Security and aims to support working families who are unable to afford the food necessary to sustain their health with their income alone. Nationally, about one in every five children participates in SNAP, and families on average receive a benefit of up to \$2.61 per person for each meal.¹¹⁹ The SNAP program has been shown to reduce hunger and improve access to healthy food options among those who utilize it.¹²⁰

The Special Supplemental Nutrition Program for Women, Infants and Children (WIC)^{vii} is a federally funded program administered by the Arizona Department of Health Services aimed to support economically disadvantaged women who are pregnant, postpartum and/or breastfeeding, along with infants and young children. The program’s services include directing participants to health services, nutrition and breastfeeding education and supplemental funding for food. In Arizona, WIC provided an average monthly benefit of \$42 per month in 2022, lower than the national average of \$48 per month.¹²¹

School meals provide another important nutritional safety net for children and their families. The National School Lunch Program (NSLP),^{viii} administered by the Arizona Department of Education (ADE) and funded by the United States Department of Agriculture (USDA), provides meals for students of low-income families at a reduced price. The Summer Food Service Program (SFSP),^{ix} also funded by the USDA and administered by ADE, works to keep all children birth to age 18 fed when school is out of session by providing free meals (breakfast, lunch, supper) and snacks at community sites. SFSP unites community sponsors like camps, faith-based organizations and schools with sites like parks, libraries, community centers and apartment complexes in high-need areas to distribute food.¹²² In March 2020, in response to school closures due to the COVID-19 pandemic, the USDA issued waivers allowing year-round operation of SFSP to serve meals to children of all ages engaging in remote learning; these waivers remained in effect through June 2022 and led to increased meal service through SFSP compared to NSLP for many schools.¹²³ The Child and Adult Care Food Program (CACFP),^x also funded by the USDA, gives reimbursements to participating child care centers, preschools, emergency centers and after-school programs for nutritious meals and snacks served to eligible children. Eligible providers

^{vi} For more information see: <https://www.fns.usda.gov/snap/supplemental-nutrition-assistance-program> and <https://des.az.gov/na>

^{vii} For more information see: <https://www.fns.usda.gov/wic> and <https://www.azdhs.gov/prevention/azwic/>

^{viii} For more information see: <https://www.azed.gov/hns/nslp>

^{ix} For more information see: <https://www.azed.gov/hns/sfsp>

^x For more information see: <https://www.azed.gov/hns/cacfp>

include for-profit child care centers serving at least 25% free or reduced-price lunch participants or any non-profit program.¹²⁴

How the Coconino Region is faring

- Participation in SNAP by households with young children declined in the Coconino Region between SFY 2018 and 2022, as did participation across the state. The number of young children birth to age 5 participating in SNAP also decreased during those years in both the region and state. The percentage of young children participating in SNAP was higher in the region than across the state during SFY 2018 to 2021, before falling just below the state in SFY 2022. In that year, 39% of children birth to age 5 participated in SNAP in the region, compared to 40% across the state (Figure 18 & Figure 19).
- The number of children birth to age 4 enrolled in and participating in WIC in the Coconino Region and across the state generally declined in recent years, with the exception of a slight uptick in enrollment and participation in the region and state in 2022 (Figure 20).
- WIC participation rates were high in 2022, with 95% of women, 97% of infants and 90% of children enrolled receiving benefits that year in the Coconino Region (Figure 21).
- The number of lunches served through the NSLP, SFSP and CACFP meal programs varied substantially between program years 2019-20 and 2021-22. After the change in school meal policy following the start of the COVID-19 pandemic, meal service through SFSP increased almost sixfold in Coconino County between 2019-20 and 2020-21, while meal service through NSLP fell almost fourfold. In the 2021-22 school year, NSLP meal service increased and SFSP meal service decreased, although neither program has yet returned to pre-pandemic levels (Figure 22).
- Compared to 2019-20, the number of lunches served through CACFP more than doubled in Coconino County in 2021-22, indicating higher ongoing participation in CACFP following the onset of the COVID-19 pandemic (Figure 22).

Note: Due to the COVID-19 pandemic, the USDA issued a substantial number of waivers for school nutrition programs to allow greater flexibility for schools to get meals to students in need. More information on the pandemic's effect on school nutrition can be found on the ADE website: <https://www.azed.gov/hns/covid19>

Employment

Unemployment and underemployment^{xi} can impact families in ways that affect children's health and well-being.¹²⁵ Unemployment can limit access to resources that support children's physical and mental health, like health insurance, and can also contribute to family stress, conflict, homelessness and child abuse.^{126, 127} Children with parents who have lost their jobs may also experience poorer school performance and behavioral issues, resulting in grade repetition, suspension or expulsion.¹²⁸

Education and employment support programs for parents and caregivers are important for increasing wages and improving the economic stability of families. "Two-generation" or "2Gen" approaches address the needs of both parents and children simultaneously through programs to support children and families together, such as a family literacy program that provides educational support to parents while enrolling children in free high-quality preschool.^{129, 130, 131} These programs have the goal of decreasing the intergenerational effects of poverty by building parental capacity and protective factors within families.^{132, 133, 134}

^{xi} Underemployment means that someone works fewer hours than they would like or is in a job that does not require the skills or training that they have.

How the Coconino Region is faring

- Unemployment rates in Coconino County track with Arizona's but tend to be slightly higher. Despite the spike during the onset of the COVID-19 pandemic in 2020, unemployment rates fell to their lowest level in six years in 2022 with a 4.3% unemployment rate in Coconino County and a 3.8% rate across Arizona (Figure 23).
- The labor force participation rate^{xiii} in the Coconino Region (63%) is slightly higher than that across Arizona as a whole (61%). As a result, the region also has a lower proportion of adults who are not in the labor force (37%) compared to Arizona as a whole (39%) (Table 7 & Figure 24).
- An estimated 90% of young children in the Coconino Region live in families with at least one parent in the labor force, the same as the proportion across the state (90%). A little over two-thirds of children birth to age 5 in the region (68%) live with all parents in the labor force, making it likely that these families need some form of child care (Table 8 & Figure 25).

Figure 23. Average annual unemployment rates (not seasonally adjusted), 2017 to 2022

Source: Arizona Commerce Authority (2021), Office of Economic Opportunity, Local Area Unemployment Survey (LAUS)

^{xiii} The "labor force" is all persons who are working (employed) or looking for work (unemployed). The "labor force participation rate" is the fraction of the population who are in the labor force, whether employed or unemployed. Persons not in the labor force are mostly students, stay-at-home parents, retirees, and institutionalized people. The "unemployment rate" is the fraction of the civilian labor force which are unemployed.

Table 7. Unemployment and labor-force participation for the population ages 16 and older, 2017-2021 ACS

Geography	Estimated working-age population (age 16 and older)	Unemployment rate	Labor-force participation rate	In the labor force and employed	In the labor force but unemployed	In armed forces	Not in the labor force
Coconino Region	110,109	7%	63%	58%	4%	0.0%	37%
Coconino County	118,812	8%	61%	57%	5%	0.0%	39%

The five percentages in each row should sum to 100% but may not because of rounding. Please note that due to the way the ACS asks about family relationships, children living with two unmarried, cohabitating parents are not counted as living with two parents (these children are counted in the 'one parent' category).

Housing instability and internet access

Housing instability can have harmful effects on the development of young children. High housing costs relative to family income are associated with increased risk for overcrowding, frequent moving, poor nutrition, declines in mental health and homelessness.^{135, 136, 137} High relative housing costs leave inadequate funds for other necessities, such as food and utilities.¹³⁸ This can negatively affect the physical, social-emotional and cognitive development of children, with severe forms of housing instability associated with poorer performance in school.^{139, 140}

Another increasingly important utility in homes is reliable internet access. Access to broadband (high-speed) internet enables quick access to a far greater number of resources and information, telehealth options and other opportunities that can be critical for education and employment. Internet access has been deemed a “super determinant” of health because of its influence on more traditional social determinants of health such as education, employment, health care access and social connection.¹⁴¹ Household access to computers and high-speed internet is also important for school-aged children who may need this technology for school assignments and projects, particularly during the later years of primary education and beyond.¹⁴² Lack of access to reliable high-speed internet disproportionately occurs in rural areas and pockets of segregated urban areas, and this disparate access is known as the digital divide. Due to the importance of high-speed internet access, the federal government has instituted several funding initiatives to improve access to and the affordability of high-speed internet, including in Arizona.^{xiii}

How the Coconino Region is faring

- Traditionally, housing has been deemed affordable for families if it costs less than 30% of annual household income.¹⁴³ Just over one third (34%) of households in the region spend 30% or more of their income on housing, slightly higher than the proportion across the state (29%). Housing costs differ by home ownership status, with fewer homeowners in the region (19%) and state (21%) spending 30% or more of household income on housing, compared to 52% of renter-occupied households in the region and 45% across the state (Figure 26).
- The McKinney-Vento Act definition of homelessness includes children living in shelters, transitional housing, campgrounds, motels, trailer parks and cars, as well as children whose families are temporarily living within another family’s household. The number of students enrolled in public and charter schools in the region experiencing homelessness fell by more than half between 2019-20 (n=323) and 2021-22 (n=130), a much larger decrease than seen statewide (Table 9).
- More than eight in 10 households (84%) in the Coconino Region have both a computer (including smartphones) and broadband internet connectivity, just below the proportion across the state overall (88%) (Table 10).

^{xiii} For more information, please see <https://internetforall.gov/program/digital-equity-act-programs>

- Looking at the population, the majority (87%) of individuals of all ages in the Coconino Region live in households with both a computer and internet connection. Children are slightly more likely to live in a household with a computer and an internet connection, with 89% of those under age 18 with this access in the region (Figure 27 & Figure 28).

Figure 26. Percent of households spending 30% or more of household income on housing by home ownership status, 2017-2021 ACS

Coconino Region schools	323	146	130	<2%	<2%	<2%
Coconino County schools	322	261	321	<2%	<2%	<2%
Arizona	12,931	8,542	11,161	<2%	<2%	<2%

Source: Arizona Department of Education (2023). [Oct 1 Enrollment Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team.

Note: The McKinney-Vento Act provides funding and supports to ensure that children and youth experiencing homelessness have access to education. Under the McKinney-Vento Act, children are defined as homeless if they lack a “fixed, regular, and adequate nighttime address.” This includes children living in shelters, cars, transitional housing, campground, motels, and trailer parks, as well as children who are living ‘doubled up’ with another family due to loss of housing or economic hardship. More information can be found on the ADE website: <https://www.azed.gov/homeless>

Additional data tables related to *Economic Circumstances* can be found in Appendix 1 of this report.

EDUCATIONAL INDICATORS

EDUCATIONAL INDICATORS

Why it Matters

A community's K-12 education system can support positive outcomes for children, families and the overall well-being of the community. Individuals who have higher levels of education tend to live longer and healthier lives.¹⁴⁴ Graduating from high school, in particular, is associated with better health, financial stability and socio-emotional outcomes as well as a lower risk for incarceration compared to dropping out of high school.^{145, 146} Children with parents that have attained higher levels of education are more likely to do well in school, such as score higher in reading, math and science in their first four years of school and attain higher levels of education themselves.^{147, 148, 149} High-quality early learning experiences also set a strong foundation for children's learning in kindergarten, elementary school and beyond.¹⁵⁰ When children participate in high-quality early education, they are more likely to perform better in reading and math in later grades.¹⁵¹ Given these lifetime and intergenerational impacts of educational attainment, it is critical to provide substantial support for early education and promote policies and programs that encourage the success of Arizona's children.

What the Data Tell Us

School attendance and absenteeism

School attendance is an important factor in predicting the academic performance and future health of children. Chronic absenteeism, defined as missing 10% of school days in a school year, predicts a student experiencing academic difficulties and even dropping out of school entirely.¹⁵² Children who are part of a racial or ethnic minority group, have disabilities or other health conditions, or live in low-income families are at increased risk of absenteeism.^{153, 154}

How the Coconino Region is faring

- In the 2021-22 school year, 208 children were enrolled in preschool in the Coconino Region. Kindergarten through 3rd grade enrollments for the region were all much higher, ranging from a low of 1,162 in 1st grade to a high of 1,215 children enrolled in 2nd grade (Table 11).
- Kindergarten through 3rd grade chronic absence rates nearly quadrupled, increasing from 10% in the 2019-20 school year to 37% in 2021-22 in the Coconino Region, with similar increases seen across the state (Figure 29).

Table 11. Preschool to 3rd grade students enrolled in public and charter schools, 2021-22

Geography	Preschool	Kindergarten	1st Grade	2nd Grade	3rd Grade
Coconino Region schools	208	1,175	1,162	1,215	1,184
Coconino County schools	227	1,137	1,143	1,174	1,171
Arizona schools	17,840	79,423	79,202	82,342	82,243

Source: Arizona Department of Education (2023). [Oct 1 Enrollment Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team

Figure 29. Chronic absenteeism rates for kindergarten to 3rd grade students, 2019-20 to 2021-22

Source: Arizona Department of Education (2023). [Absenteeism Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team.

Note: Students are considered chronically absent if they miss more than 10% of the school days in a school year. This figure includes children who are absent due to chronic illness. Please note that school closures and transitions to distance learning substantially affected how attendance was tracked by schools in the spring of 2020.

Achievement on standardized testing

All Arizona public schools, including both district and charter schools (but not private schools), are required to administer state and federally mandated standardized tests. Between 2019 and 2022, the statewide English Language Arts (ELA) and Math assessment tool for 3rd through 8th graders in public schools was Arizona's Statewide Achievement Assessment for English Language Arts and Math (AzM2), previously called Arizona's Measurement of Educational Readiness to Inform Teaching

(AzMERIT).^{xiv, 155, 156} The *Move on When Reading* policy, enacted by the Arizona legislature in 2010, states that a 3rd grade student shall not be promoted to 4th grade if their reading score falls far below the 3rd grade level, as established by the State Board of Education.^{xv, 157}

These policies are intended to help identify struggling readers who may benefit from more targeted literacy interventions. Children's 3rd grade reading comprehension and proficiency skills can predict their future academic success, such as their likelihood of graduating high school and attending college.¹⁵⁸ Poor reading skills are associated with a six-fold increase in the likelihood of dropping out of high school in comparison to proficient readers.¹⁵⁹

How the Coconino Region is faring

- In the 2021-22 school year, 37% of 3rd grade students in the Coconino Region were meeting or exceeding proficiency expectations for 3rd grade English Language Arts, just below the proportion across the state (41%). A slightly lower percentage (33%) were meeting or exceeding proficiency expectations for Math, again a lower proportion than for students across the state (40%) (Table 12 & Table 13).
- In the region, passing rates for the 3rd grade English Language Arts assessment increased from 30% in 2020-21 to 37% in 2021-22. During the same period, passing rates increased from 35% to 41% across the state (Figure 30).
- Third grade Math passing rates also increased in the region and state between 2020-21 and 2021-22, from 26% to 33% in the region, and from 36% to 40% across the state (Figure 31).

^{xiv} In 2022, AzM2 was replaced by Arizona's Academic Standards Assessment (AASA).

^{xv} Exceptions exist for students identified with or being evaluated for learning disabilities or reading impairments, English language learners and those who have demonstrated reading proficiency on alternate forms of assessment approved by the State Board of Education. Students who test in the 'far below' proficiency range can also be promoted to 4th grade if they complete summer school and then demonstrate reading at a proficient level. Given these exceptions, historically very few 3rd grade students (<1%) have been retained due to *Move on When Reading*. As of 2022, schools with early elementary grade students are now required to screen all kindergarten and first grade students for dyslexia and have at least one teacher who has complete ADE-approved trainings in reading instruction, intensifying instruction and understanding and recognizing dyslexia.

Table 12. Assessment results: 3rd Grade English Language Arts, 2021-22

Geography	Students Tested	Falls Far Below	Approaches	Meets	Exceeds	Passing
Coconino Region schools	N/A	52%	12%	24%	13%	37%
Coconino County schools	1,106	53%	11%	23%	13%	36%
Arizona schools	79,586	47%	12%	26%	15%	41%

Note: Comparable regional passing rates were not available for 2018-19 due to differences in how the data were pulled.

Graduation rates and adult educational attainment

High school graduation and dropout rates within a region can provide insight into the assets within and challenges faced by a community and its future workforce. Adults who graduated from high school have higher rates of employment, higher incomes and better overall health compared to adults who dropped out of high school, even if they received a high school equivalency degree, such as the General Educational Development certificate (GED).¹⁶⁰ Maternal education is associated with an array of child outcomes starting with infant health,^{161, 162, 163} and both targeted and universal programs serving children from families with lower educational backgrounds can support child development.^{164, 165}

In contrast to the U.S. as a whole, Arizona has a larger proportion of disconnected youth, defined as teenagers ages 16 to 19 who are neither attending school nor employed,^{xvi} which has been linked to negative physical and mental health outcomes and higher rates of unemployment.¹⁶⁶ Native youth, both nationally and in Arizona, are disproportionately disconnected and therefore particularly vulnerable to these negative outcomes and may need additional support.¹⁶⁷

How the Coconino Region is faring

- Four- and five-year graduation rates in the Coconino Region have remained above state rates in recent years. In 2021 (the most recent year of data available for both rates), the four-year graduation rate for the region was 84% and the five-year graduation rate was 88%. Both rates were higher than state four- and five-year graduation rates that year (76% and 79%, respectively) (Figure 32 & Table 14).
- The 7th-12th grade dropout rate for the Coconino Region rose overall from 1% in 2019-20 to 5% in 2021-22 (Table 15).
- More than seven in 10 (72%) adults in the Coconino Region have more than a high-school education, higher than the proportion across the state (65%). The share of adults with a Bachelor's degree or higher educational attainment (40%) is notable higher in the region than in Arizona overall (31%) (Figure 33).
- In 2020, 87% of births in the Coconino Region were to mothers who had at least a high school diploma, GED or higher educational attainment, decreasing slightly to 86% in 2021, similar to proportions across Arizona in 2020 (84%) and 2021 (85%) (Table 16).

^{xvi} Age ranges used for 'disconnected youth' vary by source, with some estimates including both teenagers ages 16-19 and young adults ages 20-24 and others focusing on only teenagers or young adults.

Figure 32. Trends in 4-year and 5-year graduation rates, 2020 to 2022

Source: Arizona Department of Education (2023). [Graduation Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team

Note: Regional data were not available for 2020 4-year graduation rates, and 5-year graduation rates for 2022 had yet to be released at the time of the data pull for this report (December 2023). Regional graduation rates appear lower than county rates in part due to the presence of several large charter schools in the region that serve distance and virtual students.

Table 14. Trends in 4-year and 5-year graduation rates, 2020 to 2022

Geography	4-Year Graduation Rates			5-Year Graduation Rates		
	2020	2021	2022	2020	2021	2022
Coconino Region schools	N/A	84%	86%	87%	88%	N/A
Coconino County schools	85%	83%	84%	87%	86%	89%
Arizona schools	78%	76%	77%	81%	79%	80%

Source: Arizona Department of Education (2023). [Oct 1 Enrollment Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team.

Note: Regional data were not available for 2020 4-year graduation rates, and 5-year graduation rates for 2022 had yet to be released at the time of the data pull for this report (December 2023). Regional graduation rates appear lower than county rates in part due to the presence of several large charter schools in the region that serve distance and virtual students. The 5-year graduation rate reflects the percentage of students who graduated high school within 5 years of entry. See <https://www.azed.gov/sites/default/files/2017/08/2018%2006%2001%20Graduation%20DO%20and%20Persistence%20Rate%20Tech%20Manual.pdf?id=598a34233217e10ce06647ff>

Table 15. 7th to 12th grade dropout rates, 2019-20 to 2021-22

Geography	Dropout Rate, 2019-20	Dropout Rate, 2020-21	Dropout Rate, 2021-22
Coconino Region schools	1%	5%	5%
Coconino County schools	2%	6%	6%
Arizona Schools	3%	4%	5%

Source: Arizona Department of Education (2023). [Dropout Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team

Notes: Dropouts are defined by ADE as students who were enrolled in school at any time during the school year but were not enrolled at the end of the year and who did not transfer to another school, graduate, or die. Dropout rates are calculated by dividing the number of dropouts by the total enrollment. In many elementary districts, dropout rates reflect students who transferred out and were lost to follow-up.

Figure 33. Level of education for the adult population (ages 25 and older), 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey five-year estimates 2017-2021, Table B15002

Note: The five percentages in each bar should sum to 100%, but may not because of rounding.

Table 16. Level of education for the mothers of babies born in 2020 and 2021

Geography	Calendar year	Number of births	Mother had less than a high-school education	Mother finished high school or had GED	Mother had more than a high-school education
Coconino Region	2020	1,263	12%	25%	62%
	2021	1,227	13%	25%	61%
Coconino County	2020	1,330	11%	27%	61%
	2021	1,300	12%	27%	61%
ARIZONA	2020	76,781	15%	27%	57%
	2021	77,857	14%	27%	58%

Source: Arizona Department of Health Services (2023). [Vital Statistics Births dataset]. Unpublished data.

Note: Mothers of twins are counted twice in this table. A small number of births are missing data on maternal educational attainment, so percentages in this table may not sum to 100%.

Additional data tables related to *Educational Indicators* can be found in Appendix 1 of this report.

EARLY LEARNING

EARLY LEARNING

Why it Matters

Early childhood is a pivotal time for building crucial physical, cognitive and social-emotional skills.¹⁶⁸ ¹⁶⁹ Early experiences are important for healthy brain development and set the stage for lifelong learning and well-being.^{170, 171, 172} Just as rich, stimulating environments can promote healthy development, early negative experiences can also have lasting effects.^{173, 174} However, considering the major COVID-19 pandemic-related challenges experienced by many Arizona families, it is important to remember that predicted short- and long-term effects of adverse experiences are not inevitable.^{175, 176} Access to quality early care and learning environments can be a powerful protective factor for every child, and the effects can be particularly life-changing for children facing chronic stressors and for children with disabilities.^{177, 178}

Quality early care and educational experiences help children develop into capable learners by supporting many crucial systems in the body.¹⁷⁹ In addition to promoting healthy brain development, positive and adverse experiences in the first few years of life can shape a child's immune functioning, ability to handle stress in a healthy way and capacity to learn and thrive.¹⁸⁰ Each of these factors contribute to being a skillful learner.¹⁸¹

What the Data Tell Us

Access to early care and education

Early childhood systems play a key role in supporting children, parents, caregivers and communities as a whole.^{182, 183} Unfortunately, many Arizona families continue to face obstacles when seeking quality early care and education. Communities in both urban and rural areas of Arizona face a gap between the number of young children and licensed child care slots.^{184, 185, 186, 187} According to the Center for American Progress, almost half of Arizonans (48%), including the majority of rural, low-income and Hispanic or Latino families, live in a “child care desert,” defined as areas where there are three times as many children as there are available child care opportunities.^{188, 189}

Analyses by the Bipartisan Policy Center indicate that Arizona needed an additional 76,740 licensed or registered early care and education slots to have enough for all young children in working families in 2019.¹⁹⁰ Because the COVID-19 pandemic forced many child care centers and home-based providers to close either temporarily or permanently, care has been disrupted for many more families in Arizona and nationwide.¹⁹¹ Disruptions to child care arrangements may have been especially burdensome for Hispanic and Latino households,¹⁹² which is meaningful to Arizona given the high proportion of young children who are Hispanic or Latino compared to children nationwide. Parents and caregivers in Hispanic and Latino households were less likely to use paid leave or to simultaneously supervise their children while working – likely due to lower access to paid leave and telework options – and more likely to leave or lose their job as a result.¹⁹³

Availability and cost are especially challenging for parents seeking care for infants and young children in Arizona. For example, a family with one infant and one preschooler can expect to pay about \$1,670 per month for a licensed child care provider.¹⁹⁴ This monthly cost exceeds what many Arizonans pay per month for housing, creating potential financial challenges that are further compounded for families with multiple children under the age of 6.^{xvii, 195, 196} The Arizona Department of Economic Security (DES) provides child care assistance to financially eligible families, including specific funding for families involved with the Arizona Department of Child Safety (DCS).¹⁹⁷ However, families that are eligible to receive funding may not have access to child care services in their community that are licensed or that accept assistance payments, leaving them unable to utilize the funding.^{198, 199}

How the Coconino Region is faring

- In the Coconino Region, 45% of children (ages 3 and 4) are estimated to be enrolled in preschool^{xviii} or kindergarten, which is a higher proportion than across the state (37%). Preschool enrollment in the region has decreased slightly in recent years from 46% to 45%, as has state preschool enrollment (37% to 36% during the same period). In 2021, preschool enrollment in Arizona hit a 10-year low,²⁰⁰ which makes the Coconino Region's decrease in enrollments not surprising (Figure 34).
- Nearly all licensed child care capacity in the region is provided by child care centers (99.6%), with less than 1% provided by family child care providers. Given that there are 5,183 children with all parents in the labor force in the region according to the 2017-2021 American Community Survey (ACS), an availability of only 3,147 center-based child care slots (the most available type of care in the region), suggests that many of these parents face challenges in finding quality child care for their children (Table 8 & Table 17).
- An area is labeled a child care desert if the ratio of children to child care slots is 3 to 1 or more. Looking collectively across all children birth to age 5, the Coconino Region is not considered a desert. However, infant care availability is much more limited. There are nearly eight (7.8) times the number of infants in the region as available slots for those children. Across the state this deficit is even more extreme, with 10 times the number of infants to available infant care slots. For 1-year olds in the region, there is a ratio of three 1-year-old children to every slot, the region also qualifies as a child care desert for that age group. There were only 157 slots for infants and 420 for 1-year olds in Arizona Department of Health Services (ADHS)-licensed child care providers in July 2023 in the region. Given that the 2020 Census estimated 2,466 children under

^{xvii} In addition to the financial challenges faced by parents paying for child care, the early care and education workforce is one of the most underpaid fields in the country. Nationally, educators working with infants and toddlers are 7.7 times more likely to live in poverty compared to K-8 teachers. The median hourly wage for a child care worker in Arizona (\$11.97) is \$13.19 less per hour than what is considered a living wage for a single parent with 1 child (\$25.16). For more information on early care and education workforce wages visit <https://cscce.berkeley.edu/workforce-index-2020/the-early-educator-workforce/early-educator-pay-economic-insecurity-across-the-states/>

^{xviii} The American Community Survey uses the terms nursery school and preschool interchangeably.

age 2 in the region, this child care capacity may not meet the needs of all who want or need care for their very young children (Table 18, Figure 35 & Table 3).

- The median monthly costs of child care provided by certified family homes in Coconino County are the lowest priced type of care in the region at \$525 per month for all children birth to age 5 for full-time care. For other types of care, care for infants is the most expensive in the county and the state, with the median monthly cost for infant care in licensed centers (\$945) and small group homes (\$735) in the county just below the costs of that care across the state (\$949 and \$761, respectively). Only infant care in public schools in the county (\$1,050) exceeds infant care costs across the state (\$1,011). Licensed centers and public schools providing child care in Coconino County are notably more expensive than home-based care (Figure 36), and there are relatively few slots with the more budget-friendly providers.
- Child care costs as a percentage of income are similar in Coconino County and the state overall. In 2022, sending an infant to a licensed center in Coconino County cost approximately one-sixth (15%) of a family's income, the same as for families across the state (15%). The percentage of income spent on older children's care is slightly lower in comparison in both the region and state (Figure 37).
- Median child care costs have also been increasing in the county and state since 2018. For example, the cost of care for the most available type of care in the county, licensed centers, increased 25% for one infant, 20% for one 1-2 year old and 15% for one 3-5 year old between 2018 and 2022 (Table 19).
- The number of children eligible for and receiving DES child care assistance in the region has mirrored the pattern seen across the state in recent years. Increases in both the number of children eligible for and the number of children receiving assistance in the year after the onset of the COVID-19 pandemic (2021) were followed by decreases in both the region and state in 2022. The proportion of eligible families not using DES child care assistance also decreased in the state from 2020 (18.3%) to 2022 (9.2%). However, in the Coconino Region, decreases seen from 2020 (26.5%) to 2021 (9%) were followed by an increase in 2022, when 11% of eligible families did not use these assistance (Figure 38 & Figure 39).
- Children are automatically eligible for DES child care assistance when they are involved with DCS.^{xix} For DCS-involved children, the number of children eligible for assistance in the region has decreased in recent years, from 156 young children in 2018 to 121 in 2022, mirroring the pattern seen across the state. Again, like the pattern seen across the state, the receipt of DES assistance among eligible DCS-involved children increased from 2020 to 2021, but then decreased again in 2022 in the region (Figure 40).

^{xix} Children involved with DCS include children who have been removed by DCS and placed with a foster family or kinship caregiver as well as children who are residing with their own family but receiving services from DCS (such as in-home family support and counseling). Families of these children are not required to pay a co-pay for child care.

Figure 34. School enrollment for children ages 3 to 4, 2012-2016 and 2017-2021 ACS

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table B14003. U.S. Census Bureau. (2017). American Community Survey 5-year estimates 2012-2016, Table B14003

Note: In this table, “school” may include nursery school, preschool, or kindergarten.

Table 17. Number and Capacity of Early Care & Education Providers active in the National Data System for Child Care, May 2023

Geography	Total ECE Providers		Child care centers		Family child care providers		Nannies or individual providers	
	Number	Capacity	Number	Capacity	Number	Capacity	Number	Capacity
Coconino Region	50	3,161	48	3,147	2	14	0	0
Coconino County	43	2,931	43	2,931	0	0	0	0
Arizona	2,454	211,860	1,933	208,407	516	3,435	5	18

Source: Arizona Department of Economic Security (2023). [Child Care Administration dataset]. Unpublished data.

Note: Providers in this table are those who were active in the National Data System for Child Care NACCRRAware database as of May 2023. This database of child care providers includes most state-licensed child care providers in the state of Arizona, but the database does not include informal or unlicensed providers or providers who are licensed through military or tribal authorities. Please also note that not all school-based preschools or Head Start centers participate in this data system (whereas all center-based facilities are required to be licensed and thus will appear in the ADHS licensing dataset in Table 18). Both home-based providers listed in this table are located in Winslow (which is part of Coconino Region but not Coconino County).

Figure 35. Ratio of children to slots in ADHS-licensed child care facilities, July 2023

Coconino Region

Arizona

Source: U.S. Census Bureau (2023). 2020 Decennial Census, Demographic and Housing Characteristics (DHC), Tables P1, P14. ADHS (2023). [Child Care Licensing Database]. Retrieved from <https://www.azdhs.gov/licensing/childcare-facilities/index.php#parents-databases> on 12 July 2023

Note: ADHS licenses most child care centers in the state of Arizona, except for those regulated by military or tribal authorities. While these licensed slots do not account for home-based care, as evidenced in Table 17, the majority of child care capacity in the region is in center-based care. Child care deserts are defined by the Center for American Progress as areas where there are more than three times as many children as available child care slots. To see a nationwide map of childcare supply, visit <https://childcaredeserts.org/>

Table 18. ADHS-licensed child care providers by age of child served, July 2023

Geography	Licensed Providers		Infants		1-year-olds		Number of providers licensed for 2-year-olds	Number of providers licensed for 3- to 5-year-olds
	Num	Capacity	Num.	Capacity	Num.	Capacity		
Coconino Region	55	3,896	16	157	24	420	29	52
Coconino County	53	3,795	13	86	20	213	28	52
Arizona	2,344	246,369	822	7,474	1,136	17,323	1,217	2,175

Source: U.S. Census Bureau (2023). 2020 Decennial Census, Demographic and Housing Characteristics (DHC), Tables P1, P14. ADHS (2023). [Child Care Licensing Database]. Retrieved from <https://www.azdhs.gov/licensing/childcare-facilities/index.php#parents-databases> on 12 July 2023

Note: ADHS licenses most child care centers in the state of Arizona, except for those regulated by military or tribal authorities. While these licensed slots do not account for home-based care, as evidenced in Table 17, the vast majority of child care capacity in the region is in center-based care.

High quality early care and education

Children who begin their education in high-quality preschool programs tend to repeat grades less frequently, obtain higher scores on standardized tests, experience fewer behavior problems and are more likely to graduate from high school.²⁰¹ This provides a return on investment to society through increased educational achievement and employment, reductions in crime and better overall health of children as they mature into adults.^{202, 203} The key ingredients in positive early experiences include responsive relationships, core adaptive skills development, reduced sources of stress and appropriate nutrition – all things that quality early care and education are in a unique position to provide at the critical time to encourage optimal learning and well-being for years to come.²⁰⁴ Early care and education shapes far more than a child’s future academic achievement, and an investment in early childhood can be one of the most productive investments a community can make.²⁰⁵

One way that the quality of early child care and education is measured in Arizona is through the Quality First program.²⁰⁶ The program offers training and funding for participating schools and providers to improve the quality of the services they provide. The Quality First program also rates the quality of child care providers and preschools on a scale of one to five stars, with providers considered high quality when they have received a three-star rating or higher.²⁰⁷ Quality First providers are supported by regional funding.

How the Coconino Region is faring

- The 31 Quality First child care providers in the Coconino Region enrolled 1,197 young children in 2023. Over three-quarters (77%) of children in Quality First sites in the region were enrolled at a site with a 3-5-star rating, indicating a high quality provider (Table 20 & Table 21 & Figure 41).
- About one in seven children enrolled in a Quality First provider site in the region (157 of 1,197; 13%) were served by Quality First Scholarships in 2023 (Table 21).
- Four licensed or registered child care providers in the region are nationally accredited, representing 8% of providers in the region. These accredited providers have the capacity to serve 276 children, which represents 9% of child care capacity in the region (Table 22).
- DES defines quality environments as child care providers with a 3-, 4-, or 5-star Quality First rating, a national accreditation, or a Child Development Associate (CDA) credential for family child care providers. At the regional level in 2022, 74% of young children not involved with DCS and 94% of DCS-involved children receiving DES child care assistance were enrolled in quality environments, a higher proportion than across the state as a whole (68% non-DCS; 72% DCS) (Table 23). This suggests better access to high quality care for low-income children in the Coconino Region compared to Arizona overall.

Table 20. Quality First child care providers by funding source, state fiscal year 2023

Geography	Child care providers served	Regional Funding	DES Expansion	Buy-In

Note: This table includes only licensed or registered centers, homes, or individual providers listed in the CCR&R who have a national accreditation, such as NECPA – National Early Childhood Program Accreditation, CDA – Child Development Association, AMI – American Montessori International, or NAEYC – National Association for the Education of Young Children.

Table 23. Children receiving DES child care assistance who are enrolled in quality environments, 2022

Geography	Children ages 0-5 (non-DCS involved)			DCS-involved children ages 0-5		
	Received assistance	Enrolled in quality environment	Percent in quality environment	Received assistance	Enrolled in quality environment	Percent in quality environment
Coconino Region	164	122	74%	88	83	94%
Coconino County	139	99	71%	75	69	92%
Arizona	20,099	13,619	68%	8,268	5,969	72%

Source: Arizona Department of Economic Security (2023). [Child Care Administration dataset]. Unpublished data.

Note: Quality environments are defined by DES as child care providers with a 3-, 4-, or 5-star Quality First rating, a national accreditation, or a Child Development Associate (CDA) credential for family child care providers. DCS-involved means that DCS is involved with the child or their family. In other words, the child has been reported to DCS and determined to need some level of supervision while in their parents' home, or the child has been removed

Young children with special needs

Timely intervention can improve the language, cognitive and socio-emotional developmental outcomes of young children who have, or are at risk for, developmental delays.^{208, 209} Early intervention also reduces educational costs by decreasing the need for special education.²¹⁰ Ensuring that children have access to timely and adequate screening and intervention services from birth to age 5 can be key for preparing children for kindergarten.

In Arizona, the Arizona Early Intervention Program (AzEIP),^{xx} the Division of Developmental Disabilities (DDD),^{xxi} and the Arizona Department of Education (ADE) Early Childhood Special Education Program are designed to provide services to families with children who have special needs.^{xxii} AzEIP is a program under DES that provides early intervention and a variety of supportive services to Arizona children birth to age 2 with developmental delays or disabilities, as well as their families.²¹¹ The goal of these services is to improve the learning and development of children and inform their family members of how they can best support their child.²¹² DDD is a program under DES that provides supportive services to people of all ages with a qualifying developmental disability, including cerebral palsy, autism spectrum disorder, down syndrome, epilepsy and cognitive disabilities.²¹³ Children under the age of 6 that have been assessed by AzEIP to have a qualifying disability may also receive DDD services. At age 3, children with special needs transition from AzEIP services to their local education agency (LEA), usually a school district. Each Arizona school district is mandated to participate in Child Find^{xxiii} and to provide preschool services to children with special needs either through their own schools or through agreements with other programs such as Head Start.

According to national research, insufficient funding and staffing of these programs are the greatest obstacles to identifying and providing resources for all children who would benefit from early intervention.²¹⁴ Arizona falls in the bottom 10 states in the nation for early intervention service provision.²¹⁵ Fewer children in Arizona are accessing critical early intervention services that can identify disabilities, provide parent-coaching and encourage optimal development at home.²¹⁶ This matters because, while early education discussions often center around pre-kindergarten for 4-year-olds, research continues to point to the impact of experiences during the first three years of life as being just as crucial for healthy brain and body development.²¹⁷ Positively, Arizona has taken steps toward improving funding for early intervention, including being one of 10 states to cross-reference Medicaid and Early Intervention data to maximize federal Medicaid matching of funds.²¹⁸

How the Coconino Region is faring

- Children birth to age 2 are most frequently referred to AzEIP by physicians in both the Coconino Region and across the state. Family referrals have been consistently lower in the region than across the state in recent years, with just 9% of referrals from families in federal fiscal year (FFY) 2022 in the region compared to 21% across the state (Figure 42).
- Just over one-third (35%) of young children referred to AzEIP in FFY 2022 were found eligible (13%) or received services (22%) in the Coconino Region, slightly lower than the 37% referred

^{xx} For more information on AzEIP (which is a division of the Department of Economic Security), visit <https://www.azdes.gov/azeip/>

^{xxi} For more information on DDD (which is a division of the Department of Economic Security), visit <https://des.az.gov/services/disabilities/developmental-disabilities>

^{xxii} For more information on ADE's Early Childhood Special Education program, visit <http://www.azed.gov/ece/early-childhood-special-education/> and <http://www.azed.gov/special-education/az-find/>

^{xxiii} The Arizona Child Find program is a component of the Individuals with Disabilities Education Act (IDEA) that requires states to identify and evaluate all children with disabilities (birth through age 21) to attempt to ensure that they receive the supports and services they need.

across the state who were found eligible (16%) or received services (21%). AzEIP service coordinators in the region were similarly likely to make contact with those referred (20% no contact) compared to the state (19% no contact), and referred children were slightly more likely to have had a formal evaluation and found not to have a qualifying developmental delay (18% region; 22% state) (Figure 43).

- In the Coconino Region between 2018 and 2022, the number of children birth to age 2 receiving services from AzEIP increased notably between October 2018 (n=99) and October 2019 (n=123) but decreased over the next three years, ending at 89 children birth to age 2 receiving services as of October 1, 2022. Numbers served decreased from 2018 to 2021 across the state, but then increased from 2021 to 2022 (Figure 44).
- The Coconino Region did not see the drop in the number of children birth to age 5 receiving services from DDD from state fiscal year (SFY) 2020 to 2021 as seen across the state, but both the region and state were serving a notably lower number of children in SFY 2019 to 2022, compared to SFY 2017 and 2018. In SFY 2022, 29 children birth to age 5 received DDD services in the Coconino Region, fewer than the previous year (n=38). Across the state the number of children receiving DDD services increased from SFY 2021 and 2022 (Figure 45).
- Qualifying children may receive services from AzEIP and/or DDD, a number which can be used to estimate the total number of young children receiving early intervention services in a region. The total number of children birth to age 2 receiving AzEIP and/or DDD services^{xxiv} declined overall between SFY 2019 and 2022 in both the region and the state. However, while statewide service numbers increased between SFY 2020 and 2021, service numbers in the Coconino Region did not increase until SFY 2022, and only by a single child. In SFY 2022, 73 young children received AzEIP and/or DDD services in the region. Using 2020 Census population counts, 2.0% of children birth to age 2 were receiving AzEIP and/or DDD services in the region, compared to 2.6% across the state, in SFY 2022 (Figure 46).
- The number of preschoolers with disabilities served in LEAs has decreased in both the region and the state since state fiscal year (SFY) 2020. In SFY 2022, only 123 preschoolers with disabilities were served in the Coconino Region, the lowest number served since SFY 2018. In the region, more than four in 10 (45%) of those preschoolers were receiving services for a speech or language impairment, compared to only three in 10 (30%) across the state. Twenty-eight percent of preschoolers with disabilities receiving LEA services in the region had a development delay and another 24% had a preschool severe delay (Figure 47 & Figure 48).
- The pattern of kindergarten through 3rd grade student enrollment in special education in public and charter schools between SFY 2018 and 2022 was different for the region and the state. Enrollments increased overall in the state but decreased overall in the region over those years. In SFY 2022, 42% of the 610 students (K-3rd) enrolled in special education in the region were

^{xxiv} Please note that this is a unique count of children receiving AzEIP services, DDD services, or both AzEIP and DDD.

diagnosed with a speech or language impairment, 25% with a developmental delay and 13% with a specific learning disability, proportions similar to the state. In the region, a smaller proportion were diagnosed with autism (6%) compared to the state (11%) (Figure 49 & Figure 50).

Figure 42. Children birth to age 2 referred to AzEIP by referral source, federal fiscal years 2018 to 2022

Coconino Region

Arizona

Sources: Arizona Department of Economic Security (2023). [Arizona Early Intervention Program dataset]. Unpublished data.

Note: Other referral sources include audiologists, child care or early learning programs, foster care or adoption agencies, homeless shelters or programs, public health facilities, schools, Department of Child Safety (DCS), or referrals without a recorded sources. These referrals reflect unique children (duplicates have been removed). DCS and child care or early learning were the most frequent sources of 'other' referrals in the region.

Figure 43. Outcomes for children birth to age 2 referred to AzEIP, federal fiscal year 2022

Sources: Arizona Department of Economic Security (2023). [Arizona Early Intervention Program dataset]. Unpublished data.

Note: These referral outcomes are recorded by AzEIP service providers. “No contact” means that a service coordinator made multiple attempts to contact a child’s family but was unsuccessful. “Not interested” indicates that when contacted the family of the child did not proceed with screening for eligibility. Children who are “screened out” were not suspected to have a qualifying developmental delay based on an initial developmental screening with a service coordinator; children who are “assessed, not eligible” are those with a formal evaluation who were found to not have a qualifying developmental delay. “Invalid or Other” refers to cases where the child was over-age (age 3 or older) or residing outside Arizona, the referral was a duplicate, the referral was for information-only, or the outcome was listed as “other.”

Note: The “Other Disabilities” category includes children with emotional disturbance, deafness, deaf-blindness, hearing impairment, intellectual disability, multiple disabilities, orthopedic impairment, other health impairments such as chronic medical conditions that affect a child’s ability to participate in the educational setting, traumatic brain injury, or visual impairment.

Additional data tables related to *Early Learning* can be found in Appendix 1 of this report.

CHILD HEALTH

CHILD HEALTH

Why it Matters

The physical and mental health of both children and their caregivers are important for optimal child development and well-being. Early childhood health, and even maternal health before pregnancy, has lasting impacts on an individual's quality of life.^{219, 220} Experiences during the prenatal and early childhood periods can result in lifelong impacts on immune functioning, brain development and risk for chronic diseases.^{221, 222} Poor health in childhood can also result in lower educational attainment and socioeconomic status in adolescence, adulthood and even inter-generationally.^{223, 224} Therefore, adequate access to preventive care and treatment services is vital to support a child's long-term health, development and success.^{225, 226, 227}

What the Data Tell Us

Access to health services

Health insurance coverage is an important indicator of whether families can access, afford and utilize medical care. In Arizona, children up to age 19 can enroll in health insurance through the Arizona Health Care Cost Containment System (AHCCCS), Arizona's Medicaid program. Children whose families earn too much for AHCCCS but do not earn enough to afford private health insurance may also be enrolled in KidsCare, Arizona's Children's Health Insurance Program.^{xxv} During the COVID-19 pandemic, uninsured rates declined due to federal policies prohibiting states from disenrolling people from Medicaid.²²⁸ Despite these efforts, uninsured rates in the overall population are still high.²²⁹ One primary reason for this is perceived cost, with more than two-thirds (69.6%) of uninsured U.S. adults citing their inability to pay for health insurance as the primary reason they were uninsured.²³⁰ Families who qualify for low- or no-cost health insurance may not be aware that they qualify, or they may face administrative barriers to enrolling.²³¹

A variety of health outcomes for both mothers and infants depend on access to quality health care and support before, during and after pregnancy. Early initiation of prenatal care reduces the risk of smoking during pregnancy, pregnancy complications,^{xxvi} premature births and maternal and infant mortality.^{232, 233, 234, 235, 236} Poor access to maternal health care (e.g., hospitals with labor and delivery units, birth centers and obstetric health providers) is one factor that can contribute to these outcomes.^{237, 238, 239} Black, Hispanic, American Indian and Alaska Native people experience a disproportionate lack of access to quality health care and support for their pregnancies.^{240, 241} Lack of access to this care has

^{xxv} For more information on AHCCCS and KidsCare see: <https://www.azahcccs.gov/Members/GetCovered/Categories/KidsCare.html>

^{xxvi} One such complication is congenital syphilis, where untreated maternal syphilis is passed to the fetus and can lead to stillbirth or infant death. The number of babies born in Arizona with congenital syphilis increased more than 10-fold in the last 6 years, even though congenital syphilis can be prevented with adequate prenatal care. For more information, see:

<https://www.azdhs.gov/preparedness/epidemiology-disease-control/disease-integration-services/std-control/congenital-syphilis/index.php>

contributed to considerably higher rates of low birth weight births, preterm births and maternal and infant mortality compared to non-Hispanic White Americans.^{242, 243, 244} Efforts to increase the number of women in Arizona with access to early prenatal care, such as expanding access to telehealth care and midwifery care, could improve the health outcomes of the state's mothers and babies, especially in counties with lower access to maternal health care services.²⁴⁵

How the Coconino Region is faring

- In the Coconino Region, about one in 10 people of all ages (9%) do not have health insurance coverage, a slightly lower proportion than across the state of Arizona overall (11%) (Table 24).
- Health insurance coverage for young children specifically is similar to that of the overall population in the region, with 8% of children birth to age 5 not having health insurance, slightly higher than the proportion seen across the state (7%). The proportion of young children without health insurance has also decreased in the region, county and state in recent years (Table 24 & Figure 51).
- The proportion of births in the region paid for by AHCCCS or the Indian Health Services (IHS, which covers less than 3% of births in the Coconino Region) has remained relatively stable in the region from 49% in 2018 to 48% in 2022. This proportion has decreased in the state over those same years, from 51% to 47% (Figure 52).
- Rates of timely prenatal care have risen overall in recent years, from 69% in both the region and state in 2018 to 71% for both in 2022. In the region, 1.2% of births were to mothers who received no prenatal care at all and 4.5% were to those who had fewer than five visits, slightly lower proportions compared to births across the state (2.3% and 4.7% respectively) (Figure 53 & Figure 54).

Table 24. Health insurance coverage, 2017-2021 ACS

Geography	Estimated civilian non-institutionalized population (all ages)	Without health insurance (all ages)	Estimated number of children (ages 0-5)	Without health insurance (ages 0-5)
Coconino Region	132,839	9%	8,054	8%
Coconino County	144,279	11%	8,922	10%
Arizona	6,976,512	11%	496,410	7%

Maternal age and substance abuse

Infants' immediate and long-term health can be influenced by maternal characteristics including age and substance use during or after pregnancy. For example, teenage parents often experience increased stress and hardship in comparison to older parents and other non-parent teenagers as they are less likely to complete high school or college and more likely to maintain a lower socioeconomic status and require public assistance to make ends meet.^{246, 247, 248, 249, 250}

The use of substances during pregnancy can cause negative health complications for fetuses and babies. For example, babies born to mothers who smoked cigarettes during pregnancy are more likely to be born preterm, have low birth weight, die from sudden infant death syndrome (SIDS) and have weak lungs.^{251, 252} The use of opioids, whether prescribed or illicit, during pregnancy also poses health risks to developing fetuses including preterm birth, stillbirth and birth defects.²⁵³ It may also cause infants to experience withdrawal symptoms after birth, which is referred to as neonatal abstinence syndrome (NAS). Symptoms of NAS include sleep problems, seizures, poor feeding, dehydration, loose stool, sweating, tremors and vomiting. However, suddenly stopping opioid use while pregnant is also dangerous for both mothers and their fetuses, so access to knowledgeable health care providers and appropriate treatment options are vital for protecting both maternal and fetal health.²⁵⁴

How the Coconino Region is faring

- The region has seen an overall decrease in the proportion of births to teenaged mothers between 2018 and 2022, a pattern similar to what was seen across the state, with the exception of an uptick in the region in 2021 not seen across the state. Births to mothers under age 20 fell from 5.8% in 2018 to 3.6% in 2022 in the region, from a proportion higher than across the state to one that is lower (Figure 55).
- The Coconino Region has a relatively low proportion of births to mothers who smoked cigarettes while pregnant, and this proportion has decreased from 3.7% in 2019 to 2% in 2022. Between 2018 and 2022, the region met the Healthy People 2030 target for smoking during pregnancy of 4.3% or less (Figure 56).
- Between 2018 and 2022, 137 newborns in the region were hospitalized because of maternal drug use during pregnancy, with an average length of stay of 13.1 days (Table 25). In the region, this equates to 2.1 per 100 live births requiring hospitalization due to maternal drug use, compared to 3.3 per 100 statewide.

Figure 55. Births to teenaged mothers, 2018 to 2022

Coconino Region

Arizona

Source: Arizona Department of Health Services (2023). [Vital Statistics Births dataset]. Unpublished data.

Note: Mothers of twins are counted twice in this figure. The Healthy People 2030 target for maternal use of tobacco during pregnancy was increased to 4.3% of females giving birth reporting smoking during pregnancy, or alternatively 95.7% of females reporting abstaining from smoking during pregnancy.

Figure 56. Births to mothers who smoked cigarettes during pregnancy, 2018 to 2022

Note: Mothers of twins are counted twice in this figure. The Healthy People 2030 target for maternal use of tobacco during pregnancy was increased to 4.3% of females giving birth reporting smoking during pregnancy, or alternatively 95.7% of females reporting abstaining from smoking during pregnancy.

Table 25. Newborns hospitalized because of maternal drug use during pregnancy, 2018-2022 combined

Geography	Newborns hospitalized	Average length of stay (days)
Coconino Region	137	13.1
Coconino County	160	13.2
Arizona	12,939	9.5

Source: Arizona Department of Health Services (2023). [Hospital Discharge dataset]. Unpublished data.

Note: Data on newborns hospitalizations were geocoded to FTF regions using the address provided by parents at the time of hospitalization; however, in cases where the address provided was not valid, hospitalizations could not be assigned to a region. County of residence is captured separately from addresses, meaning that counts in the county often exceed those seen in a particular region because they include all newborns regardless of address validity.

Maternal health and well-being

A pregnant woman's health and well-being are closely linked to infant and child health and development. Gestational diabetes (i.e., diabetes that only presents during the pregnancy) increases the likelihood of an infant having low blood sugar, being born preterm, being larger than average at birth, needing to be delivered through cesarean section and even developing type 2 diabetes and cardiovascular diseases later in life.^{255, 256} Children of mothers categorized as having maternal obesity have increased risk of birth complications, asthma, diabetes, heart disease and neonatal and infant mortality.^{257, 258, 259} A variety of social determinants of health have been linked to the development of diabetes and obesity, including low socioeconomic status, employment struggles, lack of health insurance and living in rural areas with fewer resources.^{260, 261, 262, 263} Risks associated with these conditions can be reduced through increased access to maternal health care before, during and after childbirth as well as planning high-risk deliveries at hospital facilities with more resources and technical expertise.^{264, 265}

Postpartum depression has a clear link to negative outcomes in infant health and development. Untreated postpartum depression can lead to infant sleeping, eating and behavioral problems, issues with maternal and infant bonding and infant developmental delays.^{266, 267} Groups that have higher rates of postpartum depression include American Indian and Alaska Native mothers, mothers who are under age 19 and mothers who smoked during or after pregnancy.²⁶⁸ The United States Preventive Services Task Force and the American Congress of Obstetricians and Gynecologists recommend assessing mothers' mental health both during pregnancy and after giving birth to facilitate early identification and intervention.²⁶⁹ In 2022, AHCCCS implemented a policy requiring depression screenings during prenatal and postpartum visits as well as well-child visits within the first 6 months of an infant's life for all enrolled mothers in Arizona.²⁷⁰ Mothers who screen positively for depression must be referred to a case manager or treatment services.²⁷¹ These screenings, as well as the ability to bill AHCCCS for the cost of

screenings, will hopefully increase the likelihood that mothers experiencing postpartum depression are referred to appropriate mental health services.

How the Coconino Region is faring

- More than a quarter of births in the region and state in recent years were to mothers with pre-pregnancy obesity, with this proportion increasing in the region from 25.9% in 2018 to 30.3% in 2022. The proportion of births to mothers with gestational diabetes has also increased in the region from 8.2% in 2018 to 12.4% in 2022 (Figure 57).
- More than one in 10 mothers in Arizona (13.7%) reported experiencing post-partum depression in 2020 according to the Pregnancy Risk Assessment Monitoring System.²⁷²

Figure 57. Births to mothers diagnosed with gestational diabetes or pre-pregnancy obesity, 2018 to 2022

Source: Arizona Department of Health Services (2023). [Vital Statistics Births dataset]. Unpublished data.
Note: Mothers of twins are counted twice in this figure. Data on gestational diabetes and pre-pregnancy obesity were not available for Arizona in 2022.

Infant health

Infants who are born preterm or at a low birth weight have a higher possibility of short- and long-term health complications. Preterm birth is defined as birth at less than 37 weeks of gestation. Risks related to preterm births include respiratory, immune, neurological, vision, hearing and intestinal developmental issues.²⁷³ Infants born preterm also have increased rates of mortality during their first 28 days to 1 year of life, longer hospitalization after birth, more health care costs and physical impairments.^{274, 275} Preterm

births are more likely among mothers who are under age 20, over the age of 35, low income, experience infections during pregnancy or engage in substance use.²⁷⁶

Low birth weight is defined as weighing less than 5 pounds and 8 ounces (2,500 grams) at birth. Babies born in this condition have a higher risk of infant mortality and long-term health problems such as diabetes, hypertension and cardiac disease.^{277, 278} Low birth weight risk factors include low maternal weight during pregnancy, preterm birth, teen pregnancy, pregnancy over the age of 35, high blood pressure, diabetes, substance use and air pollution.²⁷⁹

Newborns are admitted into neonatal intensive care units (NICUs) in hospitals for numerous reasons that can vary across medical providers and have implications for the short- and long-term health of babies and families.²⁸⁰ NICU stays can take a large emotional and financial toll on families, especially families living far from the hospital. Although NICU admissions may be an indicator of important health concerns in newborns, including low birth weight, they can also be a site of family-based interventions that can positively impact infant development and parent-child relationships.²⁸¹

For parents who are able to breastfeed, the American Academy of Pediatrics recommends breastfeeding infants exclusively for the first 6 months after birth, followed by a combination of breastfeeding and other foods for up to 2 years or longer.²⁸² Breastfeeding offers a variety of benefits to infants due to the nutrition and antibodies that human breast milk provides. These benefits include lowering an infant's risk of type 1 diabetes, obesity, ear infections, SIDS, asthma and gastrointestinal infections.²⁸³ Robust data on breastfeeding rates are only available for children served through the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) program.

How the Coconino Region is faring

- The proportion of babies born at low birth weight are similar in the region and state, with 8.6% of births being low birth weight births in the Coconino Region and 7.8% across Arizona in 2022, with a slight increase overall in the region since 2020 (7.4%) (Figure 58).
- The proportion of preterm births (less than 37 weeks gestation) was slightly lower in the region compared to the state in recent years (with the exception of 2019), with the region at 8.1% and the state at 10% in 2021 (the most recent year that both data points are available). In 2022, 9.4% of births were preterm in the region, meaning that the region just met the Healthy People 2030 target of 9.4% or fewer births before 37 weeks gestation, although this proportion in the region in 2022 was higher than in the previous two years (8.1% for both) (Figure 59).
- Births with an admission to an NICU in the region have varied over the last five years, falling below state rates between 2019 and 2021. In 2022, 7.4% of births in the region had an NICU admission (data at the state level were unavailable) (Figure 60).
- In the Coconino Region, rates of breastfeeding were higher than those across the state from 2018 through 2022. In 2022, 91% of WIC-enrolled infants were ever breastfed, compared to 79% statewide (Figure 61).

Childhood infectious disease and immunization

Immunization against preventable diseases protects both children and the surrounding community from potential illness and death. Immunization protects not only the vaccinated person but also individuals who are unable to be vaccinated, through “community immunity.”²⁸⁴ In order to attend state-licensed child care programs and public or charter schools, children are required to receive specific vaccinations or obtain an official exemption, which can be requested for medical, personal or religious reasons.²⁸⁵ Statewide and nationally, childhood immunization rates have been declining in recent years. The COVID-19 pandemic exacerbated disparities in health care access, including routine immunizations, that specifically impacted children who are Black, Hispanic, low-income, live in rural areas or lack health insurance.²⁸⁶ National survey data from the Pew Research Center also show that declining childhood immunization rates, particularly for measles, mumps and rubella (MMR), can be linked to parents' shifting attitudes towards vaccines. While the majority of U.S. parents continue to express confidence in the value of childhood vaccination for MMR, a sizable proportion expressed concerns about the necessity of vaccines and showed declining support for vaccine requirements for children to attend public schools.²⁸⁷

Respiratory syncytial virus (RSV) and influenza (flu) are leading causes of serious illness in young children, and following the COVID-19 pandemic in 2020, recent flu and RSV seasons have been more severe nationwide.^{288, 289} RSV is the most frequent cause of hospitalization in children under 1 year of age.²⁹⁰ In 2023, two new preventative therapies for RSV were approved—a single-dose antibody medication for infants, and an adult immunization for pregnant people administered in the third trimester of pregnancy.^{291, 292} These new treatments have the potential to prevent severe illness in infants and young children, but shortages of the antibody medication have led the Centers for Disease Control and Prevention (CDC) to recommend prioritizing access for the highest-risk infants. This includes infants under 6 months of age, those with underlying health conditions such as lung or heart disease and American Indian or Alaska Native infants under 8 months of age, as well as older American Indian or Alaska Native infants who live in remote areas with limited access to health care facilities.²⁹³ The flu can also cause serious illness in young children under age 5, particularly for children birth to age 2, who are the most likely to be hospitalized with flu complications.²⁹⁴ The American Academy of Pediatrics recommends that all children ages 6 months and older be vaccinated against influenza each year.²⁹⁵

How the Coconino Region is faring

- Across all required immunizations, children in child care in the Coconino Region had similar vaccination rates (DTaP^{xxvii} 90.3%; Polio 90.8%; MMR 92.7%) compared to the state as a whole (DTaP 90.6%; Polio 92.2%; MMR 93%) in the 2022-23 school year. Both the Coconino Region and the state met the Healthy People 2030 DTaP immunization target of 90% (Table 26).

^{xxvii} The DTaP vaccine immunizes against Diphtheria, Tetanus and Pertussis.

- Immunization exemptions among children in child care have been lower in the region than the state since the 2021-22 school year, and the region has seen decreases in exemptions from all immunizations since the 2019-20 school year, whereas the state has seen slight increases over those years. In the 2022-23 school year, 2.5% children in child care in the region were exempt from all vaccines, compared to 4% across the state. Religious exemptions had a varied pattern in the region between the 2018-19 and 2022-23 school years compared to a continual increase across the state over those years. In the 2022-23 school year, 4.5% of children in child care in the region received religious exemptions, compared to 5.7% across the state. Medical exemptions were higher in the region compared to the state over three of those five school years, although these exemptions are relatively rare (Figure 62).
- The Coconino Region had lower kindergarten immunization rates in the 2022-23 school year (DTaP 78.9%; Polio 79.5%; MMR 78.8%) compared to the state (DTaP 89.6%; Polio 90.3%; MMR 89.9%). Both the region and state failed to meet the Healthy People 2030 kindergarten MMR immunization target of 95% (Table 27). Regional immunization rates may be too low to assure community immunity of preventable infectious diseases. For measles, for example, 95% of children need to be vaccinated to create herd immunity in order to protect communities and achieve and maintain measles elimination.²⁹⁶
- The Coconino Region had a different pattern of children in kindergarten receiving exemptions from all required vaccinations and personal belief exemptions between the 2018-19 and 2022-23 school years compared to the state. Exemptions from all immunizations decreased in the region from the 2018-19 (5%) to 2022-23 (3.5%) school years, whereas rates across the state increased overall during that period from 3.8% to 4.6%. Personal belief exemptions remained relatively constant in the region between the 2018-19 (6%) and 2022-23 (6.2%) school years and slightly increased statewide during the same period (5.9% 2018-19; 7.3% 2022-23). The pattern of medical exemptions from immunizations have been similar in the region and state over those years and these types of exemptions are much less common in both the region and the state; in the 2022-23 school year, 0.1% of children in kindergarten in the region and 0.2% in the state received medical exemptions (Figure 63).
- The pattern of confirmed and probable cases of RSV and influenza in young children birth to age 5 were similar in both the region and state with an increase in RSV cases since 2021, but a marked decrease in influenza in 2021 that was followed by a steep increase. In 2022, there were 349 cases of RSV and 178 cases of influenza in young children in the region, the highest numbers since 2019 (Figure 64).

Infant and child hospitalization and mortality

Infant mortality refers to the death of infants under 1 year of age. Some of the most common causes of infant mortality in Arizona and the U.S. include congenital abnormalities, low birth weight, preterm birth, pregnancy complications, SIDS and unintentional injuries.^{297, 298, 299} According to provisional CDC data, infant mortality increased between 2021 and 2022 by 3% nationally, 13% in Arizona for all infants, and 21% for American Indian or Alaska Native infants nationwide, the highest increase seen for any group.³⁰⁰ In addition to increasing, the infant mortality rates for American Indian or Alaska Native (9.1 deaths per 1,000 live births) and Black infants (10.9) were also notably higher than White (4.5) or Hispanic (4.9) infants in 2022, racial disparities that have been linked to maternal care deserts, which are particularly prevalent on tribal lands.³⁰¹ This indicates a serious need to increase access to timely prenatal care, newborn screening and home visiting programs in rural and tribal areas to begin to reduce infant mortality rates.³⁰²

The leading cause of death for children birth to age 17 in the United States is unintentional injuries.³⁰³ The most prevalent accidental injuries are car crashes, drowning, falls, suffocation, fires and poisoning.³⁰⁴ Death from unintentional injuries is more common in children living in rural areas, as well as among American Indian and Alaska Native children.^{305, 306} Increased awareness and safety precautions have helped reduce childhood deaths in the last decade, including child swimming lessons, proper infant sleeping position, installing smoke detectors, keeping medications out of reach, practicing gun safety and utilizing seatbelts and helmets.³⁰⁷

How the Coconino Region is faring

- Falls were the most common unintentional injuries that led to emergency department visits for children under 5 in both the region and the state between 2016 and 2020, followed by ‘other’ injuries and being ‘struck by or against’ an object or person. During those years, there were 1,193 emergency department visits due to falls in the region, 396 for other reasons, and 335 due to being struck. The pattern of injuries prompting inpatient hospitalizations were also similar for the region and state, with falls being the most common followed by poisoning. Between 2016-2020, 16 young children in the region were hospitalized due to falls, and 15 due to poisoning (Figure 65).
- Between 2019 and 2021, the infant mortality rate was similar in the Coconino Region (5.6) and the state (5.4), and neither met the Healthy People 2030 target of 5.0 or less (Figure 66).
- Fifty-seven children birth to age 17 died in the region between 2018 and 2021. Just under one in five deaths (18%) in the region were due to accidents, with congenital malformations, intentional self-harm/suicide and SIDS each accounting for 11% of deaths in the region. Across the state, accidents (20%) and congenital malformations (15%) were the two leading causes of death of children under 18, and intentional self-harm/suicide (6%) was the fourth leading cause of death (Figure 67).

Note: The infant mortality rate is the number of infant (under age 1) deaths per 1,000 live births.

Figure 67. Leading causes of death for children birth to age 17, 2018-2021 combined

Source: Arizona Department of Health Services (2023). [Vital Statistics Mortality Report dataset]. Unpublished data.

Note: The leading causes of child death in Arizona are accidents (20%), congenital malformations (15%), low birthweight (9%), intentional self-harm/suicide (6%), and cancer/malignant neoplasms (5%). Causes of death in this figure are ordered by the leading causes of death in the region. No other cause of death caused more than 5 child deaths between 2018 and 2021.

Additional data tables related to *Child Health* can be found in Appendix 1 of this report.

FAMILY SUPPORT AND LITERACY

FAMILY SUPPORT AND LITERACY

Why it Matters

Children's long-term well-being and success is tied to their relationships and experiences with their caregivers. Adverse childhood experiences (ACEs) refer to childhood experiences of abuse, neglect and other life events that can negatively impact children's immediate and long-term well-being.^{xxviii,308}

ACEs have been associated with negative effects on development, educational achievement, future employment, mental health, drug and alcohol use and overall increased health care utilization.^{309, 310, 311}

ACEs are more prevalent among Arizona children with special health care needs and children living in poverty.³¹²

Social, physical, academic and economic outcomes are positively influenced by healthy relationships and interactions with family members and caregivers during childhood.^{313, 314, 315, 316, 317} An

understanding of, and ability to utilize, positive parenting skills is an important protective factor that reduces the likelihood of abuse and neglect, leading to better childhood and long-term outcomes.³¹⁸

Positive Childhood Experiences (PCEs), including positive parent-child relationships and feelings of safety and support, have been shown to have positive long term impacts on mental and relational health.³¹⁹ Even if children have experienced multiple ACEs, if their families show high levels of resilience and connection (e.g., working together to solve problems, staying hopeful in difficult times and talking together about things that matter to their family) they show higher rates of flourishing, characterized by healthy social and emotional development and an open and engaged approach to learning.³²⁰ These higher flourishing scores coupled with higher ACE scores point to the reality that childhood flourishing can, and does, exist amid adverse experiences and can potentially help mitigate their negative health effects.³²¹ Supporting families with the knowledge and skills to promote resilience and connection can therefore be critical for ensuring children's long-term well-being.

What the Data Tell Us

Early literacy

Parents and families can play an important role in promoting early academic skills. When families read, sing and tell stories together, it can help young children develop reading and writing fluency as well as their capacity for reading comprehension.^{322, 323, 324} Literacy practices at home have also been found to increase children's motivation to learn.³²⁵ These early literacy skills are important because they are linked to durable outcomes including elementary school performance and overall educational achievement.³²⁶

^{xxviii} ACEs include eight categories of traumatic or stressful life events experienced before the age of 18 years. The eight ACE categories are sexual abuse, physical abuse, emotional abuse, household adult mental illness, household substance abuse, domestic violence in the household, incarceration of a household member, and parental divorce or separation.

Some families may face challenges to implementing literacy practices with their young children, especially when they are low-resourced. Barriers include being unfamiliar with child development benchmarks, having limited free time to spend with children and lower access to books in the home.³²⁷ Community programs, family resource centers, home visitation and larger-scale initiatives can help caregivers implement home-based literacy practices to improve children's reading scores. Recognizing the influence caregivers can have, the American Academy of Pediatrics suggests that pediatricians provide information to families about the benefits of early literacy practices. Doctor's offices and other community locations are also places where initiatives like Read on Arizona and Reach Out & Read may provide books and other materials that families can bring home.³²⁸

Substance use disorders

Parental substance use has major implications for children's health and well-being. Children of parents with substance use disorders are frequently referred to child welfare services due to neglect or abuse and face a higher risk of later mental health and behavioral health issues, including developing substance use disorders themselves.^{329, 330} Access to treatment for substance use disorders and supports for parents and families grappling with these issues can help ameliorate the short and long-term impacts on young children.^{331, 332}

How the Coconino Region is faring

- The number of non-fatal opioid-related overdoses decreased in Coconino County between 2018 and 2020 – from 53 to 32, before increasing again in 2021 to 38. Unfortunately, this decrease in the intervening years may be because more overdoses were fatal. Overdose related deaths have increased markedly in the state in past years but had a less consistent trajectory in Coconino County, increasing overall between 2017 and 2021 from less than 10 to 28 (Figure 68). To help address opioid addiction, the state of Arizona has made three resources available in recent years; the Opioid Assistance and Referral^{xxix} line launched in 2018, no cost availability of naloxone (also called Narcan, a medication that rapidly reverses opioid overdose) to many organizations across the state through the Arizona Department of Health Services (ADHS)^{xxx} and access to naloxone without a prescription at pharmacies.

^{xxix} For more information, please see <https://www.azdhs.gov/oarline/>

^{xxx} For more information, please see <https://www.azdhs.gov/opioid/index.php#naloxone>

Figure 68. Number of non-fatal overdoses with opioids or opiates contributing to the overdose and opioid-related deaths, 2017 to 2021

Source: Arizona Department of Health Services (2021). [Opioid-related vital statistics dataset]. Unpublished data.

Child removals

In situations where the harm in remaining with their family is determined to be too great to a child, they may be removed from their home, either temporarily or permanently. Since 2014, the number of children removed from their home by the Arizona Department of Child Safety (DCS) was nearly cut in half, from 12,162 children (birth to age 17) in 2014 to 6,689 in 2022.^{333, 334, 335} This major reduction in removals is tied to multiple intentional efforts by DCS over the past decade to improve Arizona’s child welfare system and safely reduce the number of children in foster care.^{336, 337, 338}

One notable effort was the work to better define instances of neglect and reduce unnecessary investigations of families. After a 2015 review found that DCS hotline staff lacked clear guidelines for determining cases of neglect, DCS provided coaching for hotline staff and developed an improved decision-making protocol with clearer guidance. This resulted in screened-in cases declining from 70% to 55%.³³⁹

In March 2022, Arizona also passed legislation (SB 1050) which created a stricter definition of ‘neglect,’ reducing the risk that children are separated from their families simply for living in poverty.^{340, 341} Despite removals declining, Black and American Indian children continue to be overrepresented in the DCS system. Addressing this disproportionality of Black and American Indian children in the DCS system is another area of targeted effort by the agency. In June 2023, Mathematica published the Arizona Department of Child Safety Next Event Study, which aimed to identify disparities in DCS engagement and provide recommendations to further reduce unnecessary investigations and

removals.³⁴² DCS has developed several strategic initiatives to reduce these disparities, including implementing standardized training for staff and increasing involvement of family and community members in decision-making processes.³⁴³

How the Coconino Region is faring

- The number of child abuse and neglect reports assigned for investigation by DCS in Coconino County decreased overall from 308 in the first half of 2020 to 287 in the second half of 2022 while there was a slight increase overall across the state during the same period (Figure 69).
- The number of children under 18 removed by DCS decreased overall in the county and across the state between January 2020 and December 2022. However, in the county in 2022, the number of children under 18 removed by DCS increased between the first (35) and second half (47) of that year, contrary to the continued decrease across the state during that period. Neglect was the most common type of substantiated maltreatment during this period in both the county (81%) and state (71%), followed by physical abuse (15% and 24% respectively) (Figure 70 & Figure 71).

Figure 69. Child abuse and neglect reports (for children birth to age 17) assigned for investigation by DCS, Jan 2020 to Dec 2022

Note: Statewide, 0.1% of substantiated maltreatment reports (fewer than 5 in the given time period) were due to emotional abuse.

Foster care

The Family First Prevention Services Act, signed into federal law on February 9, 2018, aims to ensure children are placed in the least restrictive, most family-like setting appropriate to their unique needs when foster care is needed. One effect of the Family First Prevention Services Act has been an increased focus on kinship placements, which are placements of children with relatives or close family friends.³⁴⁴ In recent years, the number of unlicensed kinship homes has even exceeded the number of foster homes in the state. This increase is likely related to several changes at DCS, including efforts to reduce barriers

to licensure (e.g., waiving some fingerprint clearance card requirements) and funds to assist kinship caregivers with meeting licensing requirements (e.g., purchasing car seats). Additionally, an increase in the monthly kinship stipend (from \$75/month to \$300/month) for unlicensed kinship homes can help support relatives, such as grandparents, who are caring for children even if they are not currently able to pursue becoming a licensed foster home.³⁴⁵

How Arizona is faring

- In the last six months of 2022, more than half (55%) of young children birth to age 5 placed in out-of-home care by DCS across Arizona were able to remain with family through a kinship placement. Children in DCS custody most often exited out-of-home care to be reunified with their parents (55%) or adopted (39%) (Figure 72).
- The number of licensed kinship foster homes in Arizona steadily declined between January 2018 and June 2022, though there was an uptick again in the latter half of 2022. Generally, fewer than one in five kinship homes are licensed, and the number of unlicensed kinship homes increased slightly overall during the same period and exceeded the number of community foster homes during the first years of the pandemic (Figure 73).

Note: The six percentages in each row may sum to more or less than 100% because (a) children reporting Hispanic ethnicity are counted twice if their race is Black, American Indian, Asian, Pacific Islander, or any combination of two or more races, (b) children reporting any other race are not counted here unless they have Hispanic ethnicity, and (c) rounding.

Table 31. Race and ethnicity for the mothers of babies born in 2020 and 2021

Geography	Calendar year	Number of births	Mother was non-Hispanic White	Mother was Hispanic or Latina	Mother was Black or African American	Mother was American Indian or Alaska Native	Mother was Asian or Pacific Islander
Coconino Region	2020	1,263	48%	17%	2%	30%	3%
	2021	1,227	52%	16%	2%	28%	2%
Coconino County	2020	1,330	44%	15%	1%	38%	3%
	2021	1,300	48%	14%	1%	35%	2%
Arizona	2020	76,781	43%	41%	6%	5%	4%
	2021	77,857	43%	41%	6%	5%	4%

Source: Arizona Department of Health Services (2023). [Vital Statistics Births dataset]. Unpublished data.

Note: The five percentages in each row should sum to 100%, but may not because of rounding. Mothers who report more than one race or ethnicity are assigned to the one which is smaller. Mothers of twins are counted twice in this table.

Table 32. Children birth to age 5 living with parents who are foreign-born, 2017-2021 ACS

Geography	Estimated number of children (birth to 5 years old) living with one or two parents	Number and percent living with one or two foreign-born parents	
Coconino Region	7,623	599	8%
Coconino County	8,360	593	7%
Arizona	473,732	115,267	24%
United States	22,399,131	5,504,770	25%

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table B05009

Note: The term "parent" here includes stepparents.

Table 33. Language spoken at home (by persons ages 5 and older), 2017-2021 ACS

Geography	Estimated population (age 5 and older)	Speak only English at home	Speak Spanish at home	Speak languages other than English or Spanish at home
Coconino Region	127,594	80%	7%	12%
Coconino County	137,541	76%	7%	17%
Arizona	6,666,597	73%	20%	6%
United States	310,302,360	78%	13%	8%

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table C16001

Note: The three percentages in each row may not sum to 100% because of rounding. The American Community Survey (ACS) no longer specifies the proportion of the population who speak Native North American languages for geographies smaller than the state. In Arizona, Navajo and other Native American languages (including Apache, Hopi, and O'odham) are the most commonly spoken (2%), following English (73%) and Spanish (20%).

Table 34. English-language proficiency (for persons ages 5 and older), 2017-2021 ACS

Geography	Estimated population (age 5 and older)	Speak only English at home	Speak another language at home, and speak English very well	Speak another language at home, and do not speak English very well
Coconino Region	127,594	80%	16%	4%
Coconino County	137,541	76%	19%	5%
Arizona	6,666,597	73%	18%	8%
United States	310,302,360	78%	13%	8%

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table C16001

Note: The three percentages in each row should sum to 100%, but may not because of rounding.

Table 35. Limited-English-speaking households, 2017-2021 ACS

Geography	Estimated number of households	Number and percent of limited-English-speaking households	
Coconino Region	47,278	851	2%
Coconino County	51,037	1,564	3%
Arizona	2,683,557	99,159	4%
United States	124,010,992	5,241,326	4%

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table C16002

Note: A "limited-English-speaking" household is one in which no one over the age of 13 speaks English very well.

Table 36. Grandchildren birth to age 5 living in a grandparent's household, 2020 Census

Geography	Estimated number of children (birth to 5 years old) living in households	Number and percent living in their grandparent's household	
Coconino Region	7,961	1,021	13%
Coconino County	8,662	1,595	18%
Arizona	480,744	64,792	13%
United States	22,401,565	2,520,305	11%

Source: U.S. Census Bureau (2023). 2020 Decennial Census, Demographic and Housing Characteristics (DHC), Tables P14, PCT11.

Note: This table includes all children (under 6 years old) living in a household headed by a grandparent, regardless of whether the grandparent is responsible for them, or whether the child's parent lives in the same household.

Economic Circumstances

Table 37. Median annual family income, 2017-2021 ACS

Geography	Median annual income for all families	Median annual income for all families with children under 18 years old	Median annual income for married-couple families with children under 18 years old	Median annual income for single-male-headed families with children under 18 years old	Median annual income for single-female-headed families with children under 18 years old
Coconino County	\$78,800	\$74,000	\$103,300	\$48,500	\$36,800
Arizona	\$78,800	\$75,100	\$100,000	\$49,100	\$35,000
United States	\$85,000	\$82,800	\$110,000	\$50,900	\$32,600

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table B19126

Note: Half of the families in the population are estimated to have incomes above the median value, and the other half have incomes below the median.

Table 38. Children birth to age 5 living at selected poverty thresholds, 2017-2021 ACS

Geography	Estimated number of children (birth to 5 years old) who live with parents or other relatives	Percent of children under 50% of the poverty level	Percent of children between 50% and 99% of the poverty level	Percent of children between 100% and 184% of the poverty level	Percent of children at or above 185% of the poverty level
Coconino Region	7,783	7%	5%	19%	69%
Coconino County	8,676	6%	7%	18%	69%
Arizona	486,513	9%	11%	19%	61%
United States	22,940,195	9%	10%	16%	65%

Source: U.S. Census Bureau. (2022). American Community Survey 5-year estimates 2017-2021, Table B17024

Note: The four percentages in each row should sum to 100%, but may not because of rounding. In 2021, the poverty threshold for a family of two adults and two children was \$27,479; for a single parent with one child, it was \$18,677. The 185% thresholds are \$50,836 and \$34,552, respectively.

Table 39. Families with children birth to age 5 receiving TANF, state fiscal years 2018 to 2022

Educational Indicators

Table 49. Migrant students (grades PS-12) enrolled in public and charter schools, 2019-20 to 2021-22

Geography	Number of migrant students			Percent of students who were migrant students		
	2019-20	2020-21	2021-22	2019-20	2020-21	2021-22
Coconino Region	<i>Regional data not available</i>			<i>Regional data not available</i>		
Coconino County	<11	<11	<11	<2%	<2%	<2%
Arizona	4,498	3,598	6,280	0%	<2%	<2%

Source: Arizona Department of Education (2023). [Oct 1 Enrollment Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team.

Note: Migrant students are those students participating in the Arizona Migrant Education Program, a federally-funded, state-run program that provides supplemental services to the children of migrant farmworkers.

Table 50. Kindergarten to 3rd grade students with chronic absences, 2019-20 to 2021-22

Geography	Number of students with chronic absences			Percent of students who were chronically absent		
	2019-20	2020-21	2021-22	2019-20	2020-21	2021-22
Coconino Region	535	911	1,729	10%	21%	37%
Coconino County	559	869	1,767	11%	20%	40%
Arizona Schools	25,382	56,547	100,955	8%	21%	34%

Source: Arizona Department of Education (2023). [Oct 1 Enrollment Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team.

Note: Regional data were not available for 2019-20 due to differences in how data were pulled in prior RNA cycles. Students are considered chronically absent if they miss more than 10% of the school days in a school year. This figure includes children who are absent due to chronic illness. Please note that school closures and transitions to distance learning substantially affected how attendance was tracked by schools in the spring of 2020.

Table 51. 4-year and 5-year graduation rates, 2021

Geography	4-Year senior cohort (2022)	4-Year graduates (2022)	4-Year graduation rate (2022)	5-Year graduates (2022)	5-Year graduation rate (2022)
Coconino Region	1,444	1,247	86%	N/A	N/A
Coconino County	1,435	1,209	84%	1,284	89%
Arizona	90,880	69,623	77%	73,320	80%

Source: Arizona Department of Education (2023). [Graduation Dataset]. Custom tabulation of unpublished data by the UArizona CRED Team

Note: The 2022 4-year senior cohort is the number of students who are expected to graduate in 2022. 2022 5-year graduation rates were not yet published at the time regional estimates were calculated.

Early Learning

Table 52. School enrollment for children ages 3 to 4, 2017-2021 ACS

Table 74. Non-fatal hospitalizations and emergency department visits due to unintentional injuries for children birth to age 5, 2018-2022 combined

Geography	Non-fatal inpatient hospitalizations for unintentional injuries	Non-fatal emergency department visits for unintentional injuries
Coconino Region	55	1,661
Coconino County	68	3,920
Arizona	2,811	160,742

Source: Arizona Department of Health Services (2023). [Hospital Discharge dataset]. Unpublished data.

Note: Data on hospitalizations were geocoded to FTF regions using the address provided by parents or caregivers at the time of hospitalization; however, in cases where the address provided was not valid, hospitalizations could not be assigned to a region. County of residence is captured separately from addresses, meaning that counts in the county often exceed those seen in a particular region because they include all hospitalizations regardless of address validity.

Family Support & Literacy

Table 75. Number of deaths with opiates or opioids contributing, 2018-2021 combined

Geography	Number of deaths with opiates or opioids contributing, 2018-2021
Coconino Region	89
Coconino County	92
Arizona	6,315

Source: Arizona Department of Health Services (2023). [Vital Statistics dataset]. Unpublished data.

Note: About 35% of overdose deaths statewide were missing address information and thus could not be geocoded to an FTF region, but county assignments were available from death certificates.

Table 76. Substantiated maltreatment reports by type for children birth to age 17, July-Dec 2022

APPENDIX 2: METHODS AND DATA SOURCES

U.S. Census and American Community Survey Data. The U.S. Census³⁴⁶ is an enumeration of the population of the United States. It is conducted every ten years, and includes information about housing, race, and ethnicity. The 2020 U.S. Census data are available by census block. There are about 108,000 inhabited blocks in Arizona, with an average population of 66 people each. The Census data for the Coconino Region presented in this report were calculated for most indicators by identifying each block in the region and aggregating the data across all of those blocks. With the implementation of new privacy measures by the U.S. Census, some data previously available at the block level, such as grandchildren living in a grandparent's households or counts of households with children birth to age 5, are now only published at the block group or tract level. Regional estimates for these indicators were calculated by aggregating data over the census tracts which are wholly or partially contained in the region. Data from partial census tracts were apportioned according to the percentage of the 2020 Census population in that tract living inside the region.

The American Community Survey (ACS)³⁴⁷ is a survey conducted by the U.S. Census Bureau each month by mail, telephone, and face-to-face interviews. It covers many different topics, including income, language, education, employment, and housing. ACS data are available by census tract. Arizona is divided into about 1,750 census tracts, with an average of about 3,900 people in each. The ACS data for the Coconino Region were calculated by aggregating over the census tracts which are wholly or partially contained in the region. The data from partial census tracts were apportioned according to the percentage of the 2020 Census population in that tract living inside the region. The most recent and most reliable ACS data are averaged over the past five years; those are the data included in this report. They are based on surveys conducted from 2017 to 2021. In general, the reliability of ACS estimates is greater for more populated areas. Statewide estimates, for example, are more reliable than county-level estimates.

Education Data from ADE. Education data from the Arizona Department of Education (ADE) included in this report were obtained through a custom tabulation of unredacted data files conducted by the vendor on a secure ADE computer terminal in the fall of 2023. The vendor worked with the regional director to create a list of all public and charter schools in the region based on the school's physical location within the region as well as local knowledge as to whether any schools located outside the region served a substantial number of children living within the region. This list was used to assign schools and districts to the region as well to aggregate school-level data to the region-level. This methodology differs slightly from the methods that ADE uses to allocate school-level data to counties, so county and region totals may vary in some tables. Data were presented over time where available; however, due to changes in the ADE data system as well as the effects of the COVID-19 pandemic on data collection and definitions over the past three years, some indicators could not be presented as a time series.

Child Care Capacity Calculations. Lists of child care providers are maintained by multiple state agencies in Arizona, including the Arizona Department of Health Services (ADHS), which licenses

child care centers; the Arizona Department of Economic Security (DES), which maintains the Child Care Resource and Referral (CCR&R) list; and First Things First (FTF), which administers the Quality First program. ADHS child care licensing database was used as the primary source for child care capacity calculations in this report, as analyses of both statewide and region-level data showed that most child care slots in regulated providers in the region are provided by centers. Centers that only serve children ages 5-12 were removed from child care capacity calculations, as these are typically before- & after-school programs that only serve school-age children. For all tables, providers were geocoded to regions using addresses or coordinates provided in the state agency datasets to assign them to regions. Comparisons of child care capacity to the young child population are meant to provide a relative assessment of the abundance or scarcity of child care supply relative to potential demand. The child care tables in this report do not reflect the capacity of unlicensed, unregulated or informal child care providers in the region. The estimated supply may also over-estimate availability in regulated care as it did not account for child care providers that operate under licensed capacity by choice or children who enroll in multiple facilities (e.g., a child who attends part-day Head Start or school-based preschool in the morning and a child care center in the afternoon).

Change Calculations. Unless otherwise specified, changes in counts of data over time (i.e., percent increase or decrease) are calculated by subtracting the earlier number (e.g., a 2010 count) from the later number (e.g. the 2020 count) and dividing the result by the earlier number (e.g. the 2010 count). This calculation provides the percent change between the most recent count and the prior count, relative to the prior count.

Data Availability. State agency data in this report were provided to FTF by agency staff through a data request process initiated in May 2023 and extending to January 2024. Wherever possible, data were requested for multiple years to allow for the visualization of trends as well as for the most recent year available. However, due to both the constraints of agency staff and agency-maintained datasets as well as the timing of requests, not all data were available on the same time and geographic scales. This report attempts to include the most recent and complete data available, with notes indicating where data were not available for particular time periods or geographies.

Data Suppression. To protect the confidentiality of program participants, the FTF Data Dissemination and Suppression Guidelines preclude our reporting of social service and early education programming data if the count is less than 10 and preclude our reporting data related to health or developmental delay if the count is less than 6. In addition, some data received from state agencies are suppressed according to their own guidelines. ADHS does not report counts between 1 and 5; DES does not report counts between 1 and 9; ADE does not report counts less than 11. Additionally, both ADE and DES require suppression of the second-smallest value or the denominator in tables where a reader might be able to use the numbers provided to calculate a suppressed value. Throughout this report, information which is not available because of suppression guidelines is indicated by entries of “1-5” or “1-9” or “<11” for counts, or “DS” (data suppressed) for percentages. Data are sometimes not available for particular regions, either because a program did not operate in the region or because data are only available at the

county level. Cases where data are not available will be indicated by an entry of “N/A” or a table row note that states “regional data not available.”

For some data, an exact number was not available because it was the sum of several numbers provided by a state agency, and some numbers were suppressed in accordance with agency guidelines or because the number was suppressed as a second-smallest value that could be used to calculate a suppressed value. In these cases, a range of possible numbers is provided, where the true number lies within that range. For example, for data from the sum of a suppressed number of children enrolled in Child-only Temporary Assistance to Needy Families (TANF) and 12 children enrolled in a household with TANF, the entry in the table would read “13 to 21.” This is because the suppressed number of children in Child-only TANF is between 1 and 9, so the possible range of values is the sum of the known number (12) and 1 on the lower bound to the sum of the known number (12) plus 9 on the upper bound. Ranges that include numbers below the suppression threshold of less than 6 or 10 may still be included if the upper limit of the range is above 6 or 10. Since a range is provided rather than an exact number, the confidentiality of program participants is preserved.

APPENDIX 3: ZIP CODES OF THE COCONINO REGION

Figure 74. Zip Code Tabulation Areas (ZCTAs) in the Coconino Region

Source: Custom map by the Community Research, Evaluation, & Development (CRED) Team using shapefiles obtained from First Things First and the U.S. Census Bureau 2020 TIGER/Line Shapefiles (<https://www.census.gov/cgi-bin/geo/shapefiles/index.php>)

86337	29	2%	Yavapai Region
86434	14	1%	Hualapai Tribe Region, La Paz/Mohave Region
86435	217	97%	Hualapai Tribe Region
86510	20	0.4%	Navajo Nation Region

Source: U.S. Census Bureau (2020). 2020 Decennial Census, Demographic and Housing Characteristics, Table P1

Note: With the implementation of differential privacy in the 2020 Census, small area estimates now have injected 'noise' (error) to prevent accidental disclosure of Census responses. Geographies that are not primary census geographies, like ZCTAs, have noisier (or less accurate) estimates than primary geographies, like tracts. ZCTA 86053 overlaps the Coconino Region, but the portions of the ZCTA in the region is unpopulated.
